Executive Summary

Recent community level Census data show that most small communities in Nebraska have experienced population decline since 2000. However, most larger communities have experienced population growth during this same time period. In addition, small rural communities in Nebraska have experienced a decline in retailing activity in the past few decades. The Internet has also impacted retail shopping behaviors, allowing customers to purchase goods and services online that they normally purchased from businesses in their community. Given these conditions, how do rural Nebraskans feel about their community? Are they satisfied with the services provided by their community? Are they planning to move from their community in the next year? Have these views changed over the past fifteen years? Are rural Nebraskans purchasing the majority of their households' retail goods and services in their own community? How often do rural Nebraskans buy goods and services using the Internet? How have rural Nebraskans' purchasing behaviors changed during the past ten years? Does their purchasing behavior differ depending on their region, age, income, or size of community? This paper provides a detailed analysis of these questions.

This report details 2,797 responses to the 2010 Nebraska Rural Poll, the fifteenth annual effort to understand rural Nebraskans' perceptions. Respondents were asked a series of questions about their community and retail shopping. Trends for some of these questions are examined by comparing data from the fourteen previous polls to this year's results. In addition, data from the retail shopping questions will be compared to data collected in 2000. For all questions, comparisons are made among different respondent subgroups, that is, comparisons by age, occupation, region, etc. Based on these analyses, some key findings emerged:

- ***By many different measures, rural Nebraskans are positive about their community.***
 - ✓ *Many rural Nebraskans rate their community favorably on its social dimensions.*
Many rural Nebraskans rate their communities as friendly (75%), trusting (62%) and supportive (66%).
 - ✓ *Many rural Nebraskans express positive sentiments about their community.*
Just over two-thirds (68%) agree with the statement that "my community is very special to me." And 60 percent agree with the statement that "I feel I can really be myself in my community."
 - ✓ *One-half of rural Nebraskans say it would be difficult to leave their community.*
Fifty percent say it would be difficult for their household to leave their community. Less than one-third (32%) indicate it would be easy for their household to leave their community and 18 percent gave a neutral response.

- ***Residents of smaller communities are more likely than residents of larger communities to rate their community favorably on its social dimensions and to have positive sentiments about their community.***
 - ✓ *Persons living in or near smaller communities are more likely than persons living in or near larger communities to express positive sentiments about their community.*
Forty-nine percent of persons living in or near communities with less than 500 people agree with the statement that my community is the best place to live. In

comparison, 38 percent of persons living in or near communities with populations of 10,000 or more agree with this statement.

- ✓ *Persons living in or near smaller communities are more likely than persons living in or near larger communities to say it would be difficult to leave their community.*

- ***Except for a few services that are largely unavailable in rural communities, rural Nebraskans are generally satisfied with basic community services and amenities.*** At least 70 percent of rural Nebraskans are satisfied with the following services or amenities: fire protection (85%), parks and recreation (74%), library services (73%), and religious organizations (71%). On the other hand, at least one-third of rural Nebraskans are dissatisfied with the entertainment, retail shopping, streets and roads, restaurants, arts/cultural activities, and local government in their community.
- ***Most rural Nebraskans purchased at least one-half of their retail goods and services in their own community or nearest community in the past year.*** Sixty percent purchased at least one-half of the retail goods and services their household bought during the past year in their community or nearest community. Over one-third (37%) purchased between 1% and 49% of their retail goods and services in their community, while three percent purchased none of their goods and services in their community (or nearest community). In 2000, just over two-thirds (67%) of rural Nebraskans purchased at least one-half of their retail goods and services in their community or nearest community.
- ***Over two-thirds of rural Nebraskans made online purchases during the past year, compared to less than one-third in 2000.*** Sixty-eight percent of rural Nebraska purchased goods and services online during the past year. In comparison, in 2000 less than one-third (29%) of rural Nebraskans had purchased goods and services online. Thus the incidence of online shopping more than doubled during the past ten years.
- ***Many rural Nebraskans who make online purchases do so at least once a month.*** Forty-two percent of rural Nebraskans who make online purchases do so at least once a month. Just under one-half (46%) make online purchases several times a year. In 2000, only 22 percent of the respondents made online purchases at least once a month. And, over one-quarter (28%) in 2000 made online purchases once a year or less, compared to 12 percent this year.
- ***Over one-half of rural Nebraskans who made online purchases during the past year spent \$500 or more on those purchases.*** Fifty-three percent of rural Nebraskans who made online purchases during the past year spent at least \$500 on those purchases. Ten percent spent less than \$100 on their online purchases and over one-third (37%) spent between \$100 and \$499 on their household's online purchases during the past year.

Introduction

Recent community level Census data show that most small communities in Nebraska have experienced population decline since 2000. However, most larger communities have experienced population growth during this same time period. In addition, small rural communities in Nebraska have experienced a decline in retailing activity in the past few decades. Research has shown that an increasing share of the state's total retail sales has been captured by the larger retailing centers across the state. As an example, Omaha and Lincoln captured more than 64 percent of the state's total taxable retail sales in 2005. These two cities had captured 57 percent of the taxable retail sales in 1990.¹ The Internet has also impacted retail shopping behaviors, allowing customers to purchase goods and services online that they normally purchased from businesses in their community.

Given these conditions, how do rural Nebraskans feel about their community? Are they satisfied with the services provided by their community? Are they planning to move from their community in the next year? Have these views changed over the past fifteen years? Are rural Nebraskans purchasing the majority of their households' retail goods and services in their own community? How often do rural Nebraskans buy goods and services using the Internet? How have rural Nebraskans' purchasing behaviors changed during the past ten years? Does their purchasing behavior differ depending on their region, age, income, or size of community? This

1 "Retail Sale Trends Across Nebraska Counties and Localities" by Bruce B. Johnson and Ben Blomendahl, located online at <http://www.agecon.unl.edu/resource/DRNo182retailtrends.pdf>.

paper provides a detailed analysis of these questions.

The 2010 Nebraska Rural Poll is the fifteenth annual effort to understand rural Nebraskans' perceptions. Respondents were asked a series of questions about their community and retail shopping. Trends for some of these questions will be examined by comparing the data from the fourteen previous polls to this year's results. In addition, data from the retail shopping questions will be compared to data collected in 2000.

Methodology and Respondent Profile

This study is based on 2,797 responses from Nebraskans living in the 84 non-metropolitan counties in the state. A self-administered questionnaire was mailed in March and April to approximately 6,500 randomly selected households. Metropolitan counties not included in the sample were Cass, Dakota, Dixon, Douglas, Lancaster, Sarpy, Saunders, Seward and Washington. The 14-page questionnaire included questions pertaining to well-being, community, agriculture and food, energy, retail shopping, care giving and work. This paper reports only results from the community and retail shopping portions of the survey.

A 43% response rate was achieved using the total design method (Dillman, 1978). The sequence of steps used follow:

1. A pre-notification letter was sent requesting participation in the study.
2. The questionnaire was mailed with an informal letter signed by the project director approximately seven days later.
3. A reminder postcard was sent to the entire sample approximately seven days after the questionnaire had been sent.
4. Those who had not yet responded within approximately 14 days of the original mailing were sent a replacement questionnaire.

Appendix Table 1 shows demographic data from this year's study and previous rural polls, as well as similar data based on the entire nonmetropolitan population of Nebraska (using 2000 U.S. Census data). As can be seen from the table, there are some marked differences between some of the demographic variables in our sample compared to the Census data. Certainly some variance from 2000 Census data is to be expected as a result of changes that have occurred in the intervening ten years. Nonetheless, we suggest the reader use caution in generalizing our data to all rural Nebraska. However, given the random sampling frame used for this survey, the acceptable percentage of responses, and the large number of respondents, we feel the data provide useful insights into opinions of rural Nebraskans on the various issues presented in this report. The margin of error for this study is plus or minus two percent.

Since younger residents have typically been under-represented by survey respondents and older residents have been over-represented, weights were used to adjust the sample to match the age distribution in the nonmetropolitan counties in Nebraska (using U.S. Census figures).

The average age of respondents is 50 years. Seventy-one percent are married (Appendix Table 1) and 69 percent live within the city limits of a town or village. On average, respondents have lived in Nebraska 43 years and have lived in their current community 28 years. Fifty-two percent are living in or near towns or villages with populations less than 5,000. Ninety-five percent have attained at least a high school diploma.

Forty-one percent of the respondents report their 2009 approximate household income from all sources, before taxes, as below \$40,000.

Forty-seven percent report incomes over \$50,000.

Seventy-six percent were employed in 2009 on a full-time, part-time, or seasonal basis. Eighteen percent are retired. Thirty-five percent of those employed reported working in a management, professional, or education occupation. Twelve percent indicated they were employed in agriculture.

Trends in Community Ratings (1996 - 2010)

Comparisons are made between the community data collected this year to the fourteen previous studies. These were independent samples (the same people were not surveyed each year).

Community Change

To examine respondents' perceptions of how their community has changed, they were asked the question, "Communities across the nation are undergoing change. When you think about this past year, would you say...My community has changed for the..." Answer categories were better, no change or worse.

One difference in the wording of this question has occurred over the past fifteen years. Starting in 1998, the phrase "this past year" was added to the question; no time frame was given to the respondents in the first two studies. Also, in 2007 the middle response "same" was replaced with "no change."

Rural Nebraskans' views about the change in their community are about the same as last year. The proportion of rural Nebraskans that viewed positive change in their communities increased slightly this year (Figure 1). Following a seven year period of general decline, the proportion saying their community has changed

Figure 1. Community Change 1996 - 2010

for the better increased from 23 percent in 2003 to 33 percent in both 2006 and 2007. It then dipped slightly to 30 percent in 2008 and declined further to 23 percent last year (the lowest proportion of all fifteen years, also occurring in 2003). However, the proportion viewing positive change in their community increased slightly to 26 percent this year.

The proportion saying their community has stayed the same first increased from 1996 to 1998. It then remained fairly steady during the following eight years but declined in both 2006 and 2007. However, the proportion increased slightly to 48 percent in 2008 and increased further to 51 percent both last year and this year. The proportion saying their community has changed for the worse has remained fairly steady across all fifteen years, but increased from 22 percent in 2008 to 26 percent last year (the highest proportion in all years of this study), then decreased slightly to 24 percent this year.

Community Social Dimensions

Respondents were also asked each year if they would describe their communities as friendly or unfriendly, trusting or distrusting, and supportive or hostile. For each of these three dimensions, respondents were asked to rate their community using a seven-point scale between each pair of contrasting views.

The proportion of respondents who view their community as friendly has remained fairly steady over the fifteen year period, ranging from 69 to 75 percent. The proportion of respondents who view their community as trusting has also remained fairly steady, ranging from 59 to 66 percent.

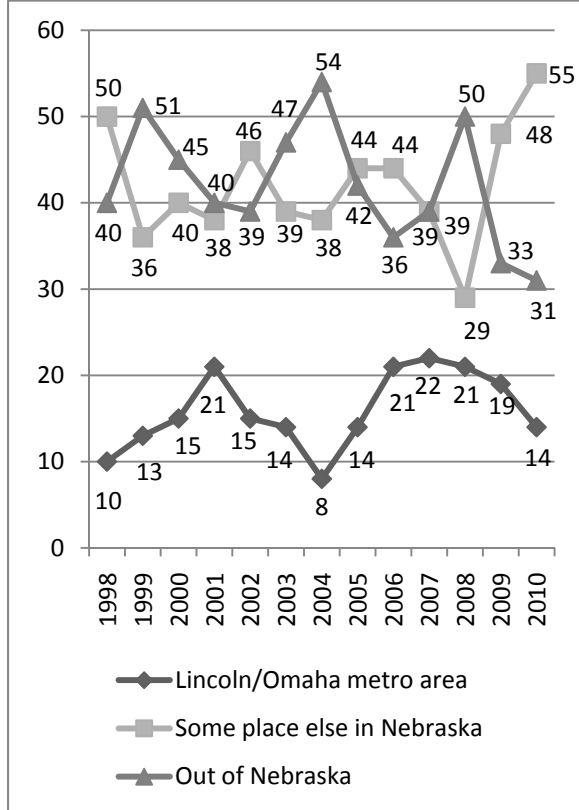

A similar pattern emerged when examining the proportion of respondents who rated their community as supportive. The proportions rating their community as supportive have ranged from 60 percent to 67 percent over the fifteen year period.

Plans to Leave the Community

Starting in 1998, respondents were asked, “Do you plan to move from your community in the next year?” The proportion planning to leave their community has remained relatively stable during the past thirteen years, ranging from 3 percent to 6 percent.

The expected destination for the persons planning to move has changed over time (Figure 2). Since the highest proportion in this study (54 percent in 2004), the proportion of expected movers planning to leave the state has generally decreased to 39 percent in 2007. However, it spiked upward in 2008 before declining sharply last year to 33 percent. It declined slightly to 31 percent this year. The proportion of expected movers planning to move to either the Omaha or Lincoln area

Figure 2. Expected Destination of Those Planning to Move: 1998 - 2010

increased from 8 percent in 2004 to 21 percent in 2006. That proportion then held fairly steady during the next three years before declining to 14 percent this year. After the proportion of expected movers planning to move to other areas of rural Nebraska declined from 44 percent in 2006 to 29 percent in 2008, it increased sharply to 48 percent last year and increased again to 55 percent this year.

Satisfaction with Community Services and Amenities

Respondents were also asked how satisfied they are with various community services and amenities each year. They were asked this in all fifteen studies; however, in 1996 they were also asked about the availability of these services. Therefore, comparisons will only be made between the last fourteen studies, when the question wording was identical. The

respondents were asked how satisfied they were with a list of 25 services and amenities, taking into consideration availability, cost, and quality.

Table 1 shows the proportions very or somewhat satisfied with the service each year. The rank ordering of these items has remained relatively stable over the fourteen years. However, the proportion of rural Nebraskans satisfied with many social services has declined across all fourteen years of the study. As an example, the proportion of rural Nebraskans satisfied with nursing home care has dropped from 63 percent in 1997 to 46 percent this year. In addition, satisfaction with entertainment services (entertainment, retail shopping and restaurants) have also generally declined over the past fourteen years. Two services added in 2006 have shown steady increases in their satisfaction levels during the past three years before declining slightly this year- cellular phone service and Internet service. In 2006, 49 percent of rural Nebraskans were satisfied with their cellular phone service. That proportion increased to 61 percent last year and stayed about the same with 60 percent this year.

The Community and Its Attributes in 2010

In this section, the 2010 data on respondents' evaluations of their communities and its attributes are examined in terms of any significant differences that may exist depending upon the size of the respondent's community, the region in which they live, or various individual attributes such as household income or age.

Community Change

The perceptions of the change occurring in their community by various demographic subgroups

* = Not asked that particular year; * New items added in 2007 that combine previous items (indented below each).

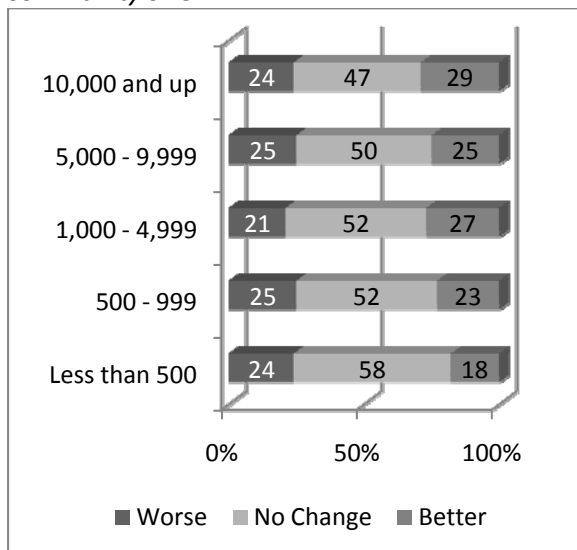

are examined (Appendix Table 2). Residents living in or near larger communities are more likely than persons living in or near smaller communities to say that their community has changed for the better. Twenty-nine percent of persons living in or near communities with populations of 10,000 or more believe their community has changed for the better, compared to 18 percent of persons living in or near communities with less than 500 people (Figure 3). Persons living in or near the smallest communities are more likely than persons living in or near larger communities to say they have seen no change in their community during the past year.

Other groups most likely to say their community has changed for the better during the past year include: persons with the highest household incomes, females, persons who have never married, persons with higher education levels and persons with food service or personal care occupations.

Community Social Dimensions

In addition to asking respondents about their

Figure 3. Perceptions of Community Change by Community Size

perceptions of the change occurring in their community, they were also asked to rate its social dimensions. They were asked if they would describe their communities as friendly or unfriendly, trusting or distrusting, and supportive or hostile. Overall, respondents rate their communities as friendly (75%), trusting (62%) and supportive (66%).

Respondents' ratings of their community on these dimensions differ by some of the characteristics examined (Appendix Table 3). Persons living in or near the smallest communities are more likely than persons living in or near the largest communities to rate their community as trusting. Two-thirds (66%) of persons living in or near communities with populations under 1,000 say their community is trusting, compared to 58 percent of persons living in or near communities with populations of 10,000 or more.

Persons with higher income levels are more likely than persons with lower incomes to rate their community as friendly and trusting. Seventy-nine percent of persons with household incomes of \$60,000 or more rate their community as friendly, compared to 68 percent of persons with household incomes under \$20,000.

When comparing responses by age, younger persons are more likely than older persons to rate their community as friendly. However, older persons are more likely than younger persons to rate their community as both trusting and supportive. Sixty-eight percent of persons age 65 and older rate their community as trusting, compared to 57 percent of persons age 19 to 29.

Respondents who are divorced/separated are the marital group *least* likely to view their community as being friendly or trusting. Persons with the highest education levels are

more likely than persons with less education to rate their community as trusting. However, persons with the lowest education levels are more likely than persons with higher education levels to view their community as supportive. When comparing responses by occupation, persons with production, transportation or warehousing occupations are the group *least* likely to view their community as both trusting and supportive.

Satisfaction with Community Services and Amenities

Next, rural residents were asked to rate how satisfied they are with 25 different services and amenities, taking into consideration cost, availability, and quality. Residents report high levels of satisfaction with some services, but other services and amenities have higher levels of dissatisfaction. Only five services listed have a higher proportion of dissatisfied responses than satisfied responses and those services are largely unavailable in rural communities.

The services or amenities respondents are most satisfied with (based on the combined percentage of “very satisfied” or “somewhat satisfied” responses) include: fire protection (85%), parks and recreation (74%), library services (73%), religious organizations (71%), education (K-12) (68%) and medical care services (67%) (Appendix Table 4). At least one-third of the respondents are either “very dissatisfied” or “somewhat dissatisfied” with entertainment (49%), retail shopping (48%), streets and roads (48%), restaurants (44%), arts/cultural activities (36%), and local government (33%).

The ten services and amenities with the greatest dissatisfaction ratings were analyzed by community size, region and various individual attributes (Appendix Table 5). Many differences emerge.

Younger respondents are more likely than older respondents to be dissatisfied with the entertainment, retail shopping and restaurants in their community. As an example, 62 percent of persons between the ages of 19 and 29 are dissatisfied with entertainment, compared to only 29 percent of persons age 65 and older.

Other groups most likely to be dissatisfied with their community’s entertainment, retail shopping and restaurants include persons with higher household incomes and persons with higher education levels.

Persons living in or near communities with populations ranging from 5,000 to 9,999 are more likely than persons from different sized communities to express dissatisfaction with the entertainment and retail shopping in their community. Persons living in or near communities with populations between 500 and 999 are the community size group most likely to be dissatisfied with the restaurants in their community.

When comparing responses by region, residents of the South Central region are the group *least* likely to report being dissatisfied with the entertainment and retail shopping in their community (see Appendix Figure 1 for the counties included in each region). Persons with occupations in agriculture are the occupation group *least* likely to be dissatisfied with their community’s entertainment and retail shopping.

Panhandle residents are more likely than persons living in other regions of the state to express dissatisfaction with the streets and roads in their community. Sixty-two percent of Panhandle residents are dissatisfied with the streets and roads, compared to 47 percent of residents of the Southeast region.

Other groups most likely to express dissatisfaction with their streets and roads include: persons under the age of 65, persons with some college education but not a four year degree, persons with healthcare support or public safety occupations, and persons with occupations classified as other.

Younger persons are more likely than older persons to be dissatisfied with the arts/cultural activities in their community. Just under one-half (47%) of persons age 19 to 29 are dissatisfied with their community's arts/cultural activities, compared to 19 percent of persons age 65 and older.

Other groups most likely to be dissatisfied with their arts/cultural activities include: persons living in or near communities with populations ranging from 500 to 999; Southeast region residents; persons with the highest household incomes; and persons with the highest education levels. Persons with occupations in agriculture are *less* likely than persons with different occupations to report being dissatisfied with the arts/cultural activities in their community.

The groups most likely to express dissatisfaction with their local government include: persons with the highest household incomes, persons age 40 to 64, persons with a high school diploma or some college education, and persons with occupations classified as other.

Panhandle residents are more likely than persons from other regions of the state to be dissatisfied with public transportation services in their community. Forty-three percent of Panhandle residents are dissatisfied with their public transportation services, compared to 24 percent of persons living in the South Central region of the state.

Other groups most likely to be dissatisfied with their public transportation services include: persons living in or near the largest communities, persons under the age of 65, persons with higher education levels and persons with healthcare support and public safety occupations.

Persons living in or near smaller communities are more likely than persons living in or near larger communities to express dissatisfaction with the cellular phone service in their community (Figure 4). Forty-four percent of persons living in or near communities with less than 500 people are dissatisfied with their community's cellular phone service, compared to 17 percent of persons living in or near communities with populations of 10,000 or more.

Other groups most likely to report being dissatisfied with the cellular phone service in their community include: residents of the Southeast region, persons under the age of 50, persons with higher education levels, persons with occupations in agriculture and persons with occupations classified as other.

Figure 4. Satisfaction with Cellular Phone Service by Community Size

Persons with the highest education levels are more likely than persons with lower educational levels to be dissatisfied with their community recycling. Thirty percent of persons with at least a four-year college degree are dissatisfied with their community recycling, compared to 13 percent of persons with less than a high school diploma.

Other groups most likely to express dissatisfaction with their community recycling include: persons living in or near the smallest communities, persons with the highest household incomes, persons between the ages of 30 and 39, and persons with occupations classified as other. Residents of the South Central region are the regional group *least* likely to be dissatisfied with their community recycling.

Younger persons are more likely than older persons to express dissatisfaction with the housing in their community. Thirty-one percent of persons age 19 to 29 are dissatisfied with the housing in their community, compared to 14 percent of persons age 65 and older.

Other groups most likely to be dissatisfied with their community’s housing include: persons

living in both the Panhandle and North Central regions, persons with higher education levels and persons with food service or personal care occupations.

Feelings About Community

The respondents were next given some statements about their community and were asked the extent to which they agree or disagree with each. Just over two-thirds (68%) agree with the statement that “my community is very special to me.” (Figure 5) And 60 percent agree with the statement that “I feel I can really be myself in my community.”

Responses to this question differ by many of the characteristics examined (Appendix Table 6). Persons living in or near smaller communities are more likely than persons living in or near larger communities to express positive sentiments about their community. Persons living in or near the smallest communities are more likely than residents of larger communities to agree with most of these statements about their community. As an example, 49 percent of persons living in or near communities with less than 500 people agree

Figure 5. Feelings About Community

with the statement that my community is the best place to live. In comparison, 38 percent of persons living in or near communities with populations of 10,000 or more agree with this statement. Older persons are more likely than younger persons to agree with each statement listed. For example, 80 percent of persons age 65 and older agree with the statement that my community is very special to me, compared to 59 percent of persons age 19 to 29. Similarly, widowed respondents are the marital group most likely to agree with each of the statements listed.

Long term residents are more likely than newcomers to the community to express positive sentiments about their community. As an example, 45 percent of persons living in their community for more than five years agree with the statement my community is the best place to live, compared to 27 percent of persons living in the community for five years or less.

Persons with agriculture occupations are the occupation group most likely to express positive sentiments about their community. Just over three-quarters (76%) of persons with occupations in agriculture agree with the statement that my community is very special to me, compared to 54 percent of persons with production, transportation or warehousing occupations.

Residents of the South Central region are more likely than persons living in different regions of the state to agree with the statements that no other place can compare to my community and my community is the best place to live. Thirty-eight percent of South Central residents agree that no other place can compare to my community, compared to 29 percent of Panhandle residents.

Persons with lower household incomes are more likely than persons with higher incomes to

agree with the statements that no other place can compare to my community and I really miss my community when I am away too long.

Persons with lower education levels are more likely than persons with more education to agree with the statements that no other place can compare to my community, my community is the best place to live, and I really miss my community when I am away too long.

Next, respondents were asked a question about how easy or difficult it would be to leave their community. The exact question wording was “Assume you were to have a discussion in your household about leaving your community for a reasonably good opportunity elsewhere. Some people might be happy to live in a new place and meet new people. Others might be very sorry to leave. How easy or difficult would it be for your household to leave your community?” They were given a seven point scale where 1 indicated very easy and 7 denoted very difficult. One-half (50%) of rural Nebraskans say it would be difficult to leave their community¹ (Figure 6). Less than one-third (32%) indicate it would be easy for their household to leave their community.

Responses to this question are examined by region, community size and various individual attributes (Appendix Table 7). Many differences emerge.

Older persons are more likely than younger persons to say it would be difficult to leave their community. Sixty-two percent of persons age 65 or older think it would be difficult to leave

¹ The responses on the 7-point scale are converted to percentages as follows: values of 1, 2, and 3 are categorized as easy; values of 5, 6, and 7 are categorized as difficult; and a value of 4 is categorized as neutral.

Figure 6. Difficulty or Ease of Leaving Community

their community, compared to 42 percent of persons age 19 to 29. Similarly, widowed persons are the marital group most likely to say it would be difficult to leave their community. Fifty-nine percent of widowed respondents believe it would be difficult to leave their community, compared to 36 percent of persons who are divorced or separated.

Long term residents of the community are more likely than newcomers to say it would be difficult to leave their community. Fifty-four percent of persons who have lived in their community for more than five years say it would be difficult to leave their community, compared to 32 percent of persons living in the community for five years or less (Figure 7).

Figure 7. Ease or Difficulty of Leaving Community by Length of Residence in Community

Other groups most likely to say it would be difficult to leave their community include: persons living in or near the smallest communities, residents of the South Central region, persons with lower education levels and persons with occupations in agriculture.

Plans to Leave the Community

To determine rural Nebraskans' migration intentions, respondents were asked, "Do you plan to move from your community in the next year?" Response options included yes, no or uncertain. A follow-up question (asked only of those who indicated they were planning to move) asked where they planned to move. The answer categories for this question were: Lincoln/Omaha metro areas, some place in Nebraska outside the Lincoln/Omaha metro areas, or some place other than Nebraska.

Only six percent indicate they are planning to move from their community in the next year, 11 percent are uncertain and 83 percent have no plans to move. Of those who are planning to move, over two-thirds (69%) plan to remain in the state, with 14 percent planning to move to either the Lincoln or Omaha area and 55 percent plan to move to another part of the state. Less than one-third (31%) are planning to leave Nebraska.

Intentions to move from their community differed by many of the characteristics examined (Appendix Table 8). Younger respondents are more likely than older respondents to be planning to move from their community in the next year. Thirteen percent of persons between the ages of 19 and 29 are planning to move next year, compared to only three percent of persons age 65 and older. An additional 21 percent of the younger respondents indicate they are uncertain if they plan to move.

Persons who are divorced/separated are the marital group most likely to be planning to move from their community. Ten percent of divorced/separated persons are planning to move in the next year, compared to five percent of both the married and widowed respondents. An additional 22 percent of the divorced/separated persons are uncertain if they plan to move.

Newcomers to the community are more likely than long-term residents to be planning to leave their community in the next year. Thirteen percent of persons who have lived in their community five years or less are planning to move in the next year, compared to five percent of persons who have lived in their community for more than five years. An additional 20 percent of newcomers are uncertain if they are planning to leave their community in the next year.

Persons living in communities with populations ranging from 5,000 to 9,999 are more likely than persons living in or near different sized communities to be planning to move from their community in the next year. And, the potential movers from communities of this size are more likely than potential movers from different sized communities to be planning to move to the Lincoln or Omaha metropolitan areas. However, over one-third (36%) of the potential movers from communities of this size are planning to leave Nebraska.

Potential movers with higher household incomes are more likely than potential movers with lower household incomes to be planning to leave the state. Over one-half (55%) of potential movers with household incomes of \$60,000 or more are planning to leave Nebraska.

Potential movers age 40 to 49 are more likely than potential movers who are both younger and older to be planning to leave the state.

Persons with higher educational levels that are planning to move in the next year are more likely than persons with less education who are planning to move to expect to leave the state. Thirty-three percent of potential movers with at least some college education plan to leave Nebraska.

Potential movers with production, transportation and warehousing occupations are more likely than potential movers with different occupations to be planning to move to the metropolitan areas within the state. One-half (50%) of potential movers with these types of occupations are planning to move to either the Omaha or Lincoln metropolitan areas. Potential movers with healthcare support or public safety occupations are the group most likely to be planning to leave the state.

Retail Shopping

Retail shopping is a community service that many rural Nebraskans express dissatisfaction with each year. In fact, the proportion of rural Nebraskans satisfied with the retail shopping in their community has declined from 53 percent in 1997 to 41 percent this year. Questions about retail shopping were included in the 2000 study and some of these questions were repeated in this year's survey to determine if any changes have occurred in rural Nebraskans' retail and online shopping behaviors in the past ten years. First, they were asked approximately what percentage of the retail goods and services their household bought during the past year were purchased in their community (or nearest community if they lived in the country).

Most rural Nebraskans (60%) purchased at least one-half of their retail goods and services in their own community or nearest community in the past year (Figure 8). Over one-third (37%) purchased between 1% and 49% of their retail goods and services in their community, while

Figure 8. Percentage of Goods and Services Purchased in Community

three percent purchased none of their goods and services in their community (or nearest community).

In 2000, just over two-thirds (67%) of rural Nebraskans purchased at least one-half of their retail goods and services in their community or nearest community. Thus, rural Nebraskans are less likely now to purchase the majority of their retail goods and services in their community than they were ten years ago.

The percentage of goods and services purchased in their community differ by community size, region and various individual attributes (Appendix Table 9). Persons living in or near larger communities are more likely than persons living in or near smaller communities to purchase the majority of their goods and services in their community or nearest community. Eighty-five percent of persons living in or near communities with populations of 10,000 or more purchase at least one-half of their retail goods and services in their community or nearest community. In comparison, 32 percent of persons living in or near communities with populations ranging from 500 to 999 purchased at least one-half of their goods and services in their community or nearest community.

Other groups most likely to purchase at least one-half of their retail goods and services in their community or nearest community include older persons and persons with lower education levels. Residents of both the Northeast and Southeast regions are *less* likely than residents of other regions to purchase at least one-half of their retail goods and services in their community or nearest community.

Next, respondents were asked if anyone in their household had used the Internet to purchase goods or services during the past year. Over two-thirds (68%) of rural Nebraskans have purchased goods and services online during the past year. In comparison, in 2000 less than one-third (29%) of rural Nebraskans had purchased goods and services online. Thus the incidence of online shopping more than doubled during the past ten years.

Certain groups were more likely than others to have purchased goods and services online (Appendix Table 10). Persons living in or near larger communities are more likely than persons living in or near smaller communities to have purchased online during the past year. Seventy-three percent of persons living in or near communities with populations of 10,000 or more have made online purchases during the past year, compared to 59 percent of persons living in or near communities with less than 500 people. This difference can likely be partially explained by the quality of Internet services available in larger communities as compared to smaller ones. In fact, residents of smaller communities are more likely than residents of larger communities to express dissatisfaction with the Internet services available in their community. So, as Internet connectivity continues to improve across the state, one would expect a growth in online shopping in these smaller communities.

Younger persons are more likely than older persons to have made online purchases during the past year. At least 80 percent of persons under the age of 50 have purchased goods and services online during the past year, compared to 31 percent of persons age 65 and older.

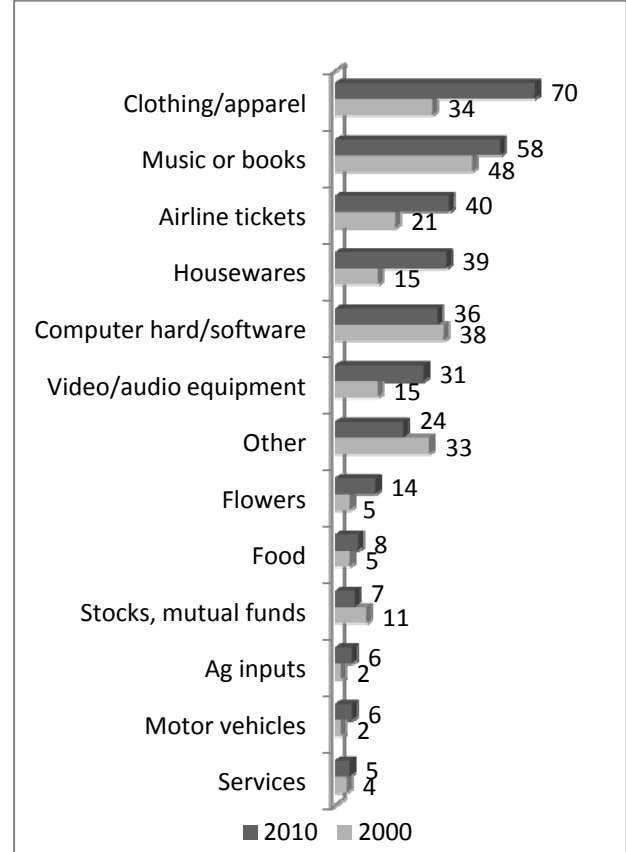

Other groups most likely to have made online purchases during the past year include: persons with higher household incomes, females, married persons, persons with higher education levels and persons with management, professional or education occupations.

The respondents who had made online purchases during the past year were asked what types of items were purchased online during the past year. Most households that shopped online purchased clothing/apparel (70%) and music or books (58%) (Figure 9). Many households also purchased airline tickets (40%), housewares (39%), computer hardware or software (36%) and video/audio equipment (31%).

In the 2000 study, the most popular online purchase was music or books, made by 48 percent of those making an online purchase. Just over one-third (34%) of the 2000 respondents had purchased clothing online. Two categories not showing increases in the past ten years are computer hardware and software and stocks and mutual funds. Thirty-eight percent of the 2000 respondents had purchased computer hardware or software online, compared to 36 percent this year.

Items purchased online differ by community size, region and various individual attributes (Appendix Table 11). Persons living in or near larger communities are more likely than persons living in or near smaller communities to have purchased airline tickets and computer hardware or software online during the past year. Persons living in or near smaller

Figure 9. Items Purchased Online in 2000 and 2010

communities are more likely than persons living in or near larger communities to have purchased agricultural inputs online. Persons living in or near communities with populations ranging from 500 to 999 are the group most likely to have purchased music or books online during the past year.

Younger persons are more likely than older persons to have purchased motor vehicles, computer hardware or software, music or books, clothing/apparel, video/audio equipment, flowers, and housewares online during the past year. Older persons are more likely than younger persons to have purchased airline tickets and stocks/mutual funds during the past year.

Panhandle residents are the regional group most likely to have purchased airline tickets and stocks and mutual funds online during the past year.

Persons with higher household incomes are more likely than persons with lower incomes to have purchased the following items online during the past year: airline tickets, computer hardware or software, music or books, clothing/apparel, video/audio equipment, stocks/mutual funds, flowers, and housewares.

Males are more likely than females to have purchased computer hardware or software, video/audio equipment, and stocks/mutual funds online during the past year. Females are more likely than males to have purchased clothing/apparel, flowers and housewares online.

Persons with higher education levels are more likely than persons with less education to have purchased the following items online during the past year: airline tickets, computer hardware or software, music or books, clothing/apparel, video/audio equipment, stocks/mutual funds, flowers, and housewares.

Persons with management, professional or education occupations are more likely than persons with different occupations to have purchased the following items online during the past year: computer hardware or software, music or books and stocks/mutual funds.

Persons with occupations in agriculture are the occupation group most likely to have purchased airline tickets and agricultural inputs online. Persons with healthcare support and public safety occupations are the group most likely to have purchased clothing/apparel and housewares online. Persons with production, transportation and warehousing occupations are the group most likely to have purchased services online and persons with construction, installation and maintenance occupations are the group most likely to have purchased video/audio equipment online.

When asked where their household normally purchased the items before they purchased them online, most rural Nebraskans (59%) had purchased them from a business in a nearby larger community (with a population of 5,000 or more) (Figure 10). Some had also purchased the items from a catalogue (27%) or from a business

Figure 10. Where Normally Purchased Items Before Purchasing Online

in their community (26%).

Persons living in or near smaller communities are more likely than persons living in or near larger communities to have normally purchased these items from a nearby larger community. At least 71 percent of persons living in or near communities with populations under 10,000 had normally purchased the items from a business in a nearby larger community, compared to 35 percent of persons living in or near communities with populations of 10,000 or more (Appendix Table 12). Persons living in or near smaller communities are also most likely to have normally purchased the items from a business in a nearby smaller community. Persons living in or near larger communities are more likely than persons living in or near smaller communities to have normally purchased the items from a business in their community or say they didn't normally purchase the item. Thus, residents of larger communities are more likely to be substituting online purchases for local purchases; whereas residents of smaller communities are substituting online purchases for purchases typically made in larger retail centers.

Residents of the Panhandle are more likely than residents of other regions of the state to not have normally purchased the items before they purchased them online. Residents of the South Central region are the group most likely to have normally purchased the item from a business in their community.

Older persons are more likely than younger persons to have normally purchased the items from a business in their community or from a catalogue. Just over one-third (35%) of persons age 50 and older normally purchased the items from a catalogue before purchasing them online, compared to 17 percent of persons age 19 to 29.

Many rural Nebraskans who make online purchases do so at least once a month (42%) (Figure 11). Just under one-half (46%) make online purchases several times a year. Rural Nebraskans make online purchases more frequently than they did ten years ago. In 2000, only 22 percent of the respondents made online purchases at least once a month. And, over one-quarter (28%) in 2000 made online purchases once a year or less, compared to 12 percent this year.

Persons with higher household incomes are more likely than persons with lower incomes to have purchased items online more frequently (Appendix Table 13). Fifty-five percent of persons with household incomes of \$60,000 or more made online purchases at least once a month, compared to 30 percent of persons with household incomes under \$20,000.

Younger persons are more likely than older persons to have made online purchases more frequently during the past year. Forty-two percent of persons age 19 to 29 made online purchases at least once a month during the past

Figure 11. How Often Made Online Purchases During Past Year in 2000 and 2010

year, compared to 19 percent of persons age 65 and older.

Other groups most likely to have made online purchases at least once a month during the past year include persons with higher education levels and persons with occupations classified as other.

Finally, respondents were also asked approximately how much their household had spent on online purchases during the past year. Over one-half (53%) of rural Nebraskans who made online purchases during the past year spent \$500 or more on those purchases (Figure 12). Ten percent spent less than \$100 on their online purchases and over one-third (37%) spent between \$100 and \$499 on their household's online purchases during the past year.

Persons with higher household incomes are more likely than persons with lower incomes to have spent more on online purchases during the past year (Appendix Table 14). Forty-four percent of persons with household incomes of \$60,000 or more spent at least \$1,000 on online purchases during the past year, compared to 14 percent of persons with household incomes under \$20,000.

Persons age 30 to 39 are the age group most likely to have spent at least \$1,000 on online

Figure 12. Amount Spent on Online Purchases During Past Year

purchases during the past year. Approximately one-third (34%) of persons age 30 to 39 spent at least \$1,000 on online purchases during the past year, compared to 16 percent of persons age 65 and older.

Other groups most likely to have spent at least \$1,000 on online purchases include persons living in or near larger communities and persons with higher education levels. The occupation groups most likely to have spent at least \$1,000 on online purchases include: those classified as other; healthcare support and public safety; and management, professional or education.

Conclusion

Most rural Nebraskans characterize their communities as friendly, trusting and supportive. Many also say their community is very special to them and that they can be themselves in their community. One-half indicate it would be difficult for their household to move from their community.

Furthermore, most rural Nebraskans are planning to stay in their community next year. Only six percent are planning to move and eleven percent are uncertain of their plans to move.

Many differences are detected by community size. Residents of smaller communities are more likely than residents of larger communities to express positive sentiments about their community. The smaller community residents are also more likely to say it would be difficult to leave their community. Thus, smaller communities have positive attributes that can be marketed to potential new residents.

Most rural Nebraska households purchase the majority of their goods and services in their own community. However, households in smaller communities purchase a smaller

percentage of their goods and services in their own community as compared with those living in larger communities.

In addition to traditional retail shopping, most rural Nebraskans are purchasing goods and services online. Over two-thirds (68%) of rural Nebraska households made online purchases during the past year. In comparison, only 29 percent of rural Nebraskans had made online purchases in 2000. Items that were purchased most often online include: clothing/apparel, music and books, airline tickets, housewares, and computer hardware and software. Many purchased frequently during the year but did not spend much on these online purchases.

Appendix Table 4. Level of Satisfaction with Community Services and Amenities

<i>Service/Amenity</i>	<i>Dissatisfied*</i>	<i>No opinion</i>	<i>Satisfied*</i>
		<i>Percentages</i>	
Entertainment	49	20	32
Retail shopping	48	11	41
Streets and roads	48	5	47
Restaurants	44	9	47
Arts/cultural activities	36	38	27
Local government	33	27	40
Public transportation services	29	53	18
Cellular phone service	26	14	60
Community recycling	25	22	54
Housing	22	19	59
Internet service	22	22	56
Law enforcement	21	14	65
Medical care services	20	14	67
Mental health services	19	59	23
Education (K - 12)	15	17	68
Parks and recreation	14	12	74
Child day care services	12	54	34
Nursing home care	12	42	46
Adult day care services	12	67	21
Sewage/waste disposal	11	24	65
Senior centers	7	46	47
Library services	7	20	73
Head Start programs	6	65	29
Religious organizations	5	24	71
Fire protection	4	11	85

* Dissatisfied represents the combined percentage of "very dissatisfied" or "somewhat dissatisfied" responses. Similarly, satisfied is the combination of "very satisfied" and "somewhat satisfied" responses.
