Executive Summary

Many items impact economies of rural communities. High-speed Internet services provide many opportunities for community residents. Nature-based tourist activities can also provide a source of income for rural communities and residents. Federal tax policy and workforce development are two additional items that affect residents and communities. Given this, what is the economic impact of the Internet to rural Nebraskans? What nature-based tourist activities are available in their communities? How do they think the federal tax policy will impact their incomes and other items? Have rural Nebraskans changed jobs or careers in the past ten years? Who do they believe is responsible for workforce development training? This paper provides a detailed analysis of these questions.

This report details 1,670 responses to the 2018 Nebraska Rural Poll, the 23rd annual effort to understand rural Nebraskans' perceptions. Respondents were asked a series of questions about economic development in their community. Comparisons are made among different respondent subgroups, that is, comparisons by community size, age, occupation, region, etc. Based on these analyses, some key findings emerged:

- The proportion of rural Nebraskans accessing the Internet using their cell phone has increased compared to two years ago. Just over three-quarters of rural Nebraskans access the Internet using their cell phone (77%), up from 70 percent in 2016.
- *Eighty-four percent of rural Nebraskans report subscribing to high-speed Internet service at home, about the same as in 2016.* Seven percent say they only use their cell phone data plan. Eight percent do not subscribe to any Internet service at home and do not have a cell phone data plan. One percent have only dial-up Internet service.
 - ✓ Persons living in or near larger communities are more likely than persons living in or near smaller communities to subscribe to a high-speed Internet service at home. At least eighty- four percent of persons living in or near communities with populations of 500 or more subscribe to a high-speed Internet service at home, compared to 78 percent of persons living in or near communities with populations less than 500.
- Not many rural Nebraskans report significant limitations from their home Internet service on their ability to do most tasks. At least one in ten report being limited significantly or not being able to play real time video games or stream online video content such as Netflix.
 - Persons living in or near smaller communities are more likely than persons living in or near larger communities to say their Internet service limits significantly or prevents them from doing the following: checking email, reading news reports, using online banking services, using social media sites, uploading files, streaming video content, playing real time video games, working from home, videoconferencing, and completing homework/ classes/certifications. As an example, two in ten persons living in or near communities with less than 500 people say their Internet service limits significantly or they can't stream online video content such as Netflix. In

contrast, approximately seven percent of persons living in or near communities with populations of 5,000 or more report these same limitations.

- Residents of the both the Northeast and Southeast regions are more likely than residents of other regions of the state to say their Internet service at least significantly limits their ability to do the following: stream online video content, play real time video games and videoconference. Approximately 15 percent of the residents of these two regions report their service limits significantly or won't allow them to stream online video content, compared to approximately 10 percent of the regions of the state.
- Most rural Nebraskans are using the Internet to save money by price matching, finding bargains online, etc. Many are also using it to generate income by occasionally buying, selling or trading items online. Six in ten rural Nebraskans are using the Internet to save money and approximately one-third are generating income by occasionally buying or selling items online. Seven percent of rural Nebraskans estimate the impact of saving money as \$1,000 or more annually.
 - ✓ For some items, the economic impact of the Internet is greater in smaller communities. Persons living in or near smaller communities are more likely than persons living in or near larger communities to have used the Internet to earn money by running and growing a home-based business and making the family farm more efficient and/or profitable. Just under one-quarter of persons living in or near the smallest communities estimate some annual economic impact from the Internet by making the family farm more efficient and/or profitable. In fact, 12 percent estimate that annual impact as being at least \$1,000. Persons living in or near mid-sized communities are the group most likely to have used the Internet to generate income by freelance work or a side job.
 - ✓ Persons with occupations in agriculture are the group most likely to have generated income by running and growing a home-based business, making the family farm more efficient and/or profitable, and regularly selling online. Just over one-half (53%) of persons with occupations in agriculture generate income from the Internet by making the family farm more efficient and/or profitable, with 24 percent reporting at least \$1,000 of impact.
- Most rural Nebraskans are aware of the following nature-based activities for tourists in or near their community: biking, hunting and fishing, hiking/walking trails and camping. Many are also aware of kayaking, canoeing or other river activities.
- **Overall, many rural Nebraskans are unsure of the expected impacts of the federal tax bill.** At least three in ten indicated they don't know how the bill will impact all of the items listed.
 - ✓ Opinions are mixed on the expected impact of the federal tax bill on their household's tax burden. Approximately one-third don't know how their household's tax burden will change, just under one-quarter say it will decrease and a similar proportion say it will increase. At least three in ten rural Nebraskans think the services provided by government and upper income Americans' tax burden will decrease as a result of the federal tax bill. Over one-third think the income gap between the upper and middle income groups and the federal deficit will increase as a result of the bill.

- Many rural Nebraskans have changed jobs and careers in the past ten years. Most rural Nebraskans expect to be in their same job ten years from now or until retirement. Few rural Nebraskans expect to switch careers in the next ten years.
- Most rural Nebraskans think individuals, colleges and universities, community colleges and primary (K – 12) education have a lot of responsibility for job training or retraining.

Introduction

Many items impact economies of rural communities. High-speed Internet services provide many opportunities for community residents. Nature-based tourist activities can also provide a source of income for rural communities and residents. Federal tax policy and workforce development are two additional items that affect residents and communities. Given this, what is the economic impact of the Internet to rural Nebraskans? What naturebased tourist activities are available in their communities? How do they think the federal tax policy will impact their incomes and other items? Have rural Nebraskans changed jobs or careers in the past ten years? Who do they believe is responsible for workforce development training? This paper provides a detailed analysis of these questions.

This report details 1,670 responses to the 2018 Nebraska Rural Poll, the 23rd annual effort to understand rural Nebraskans' perceptions. Respondents were asked a series of questions about economic development in their community.

Methodology and Respondent Profile

This study is based on 1,670 responses from Nebraskans living in 86 counties in the state.¹ A self-administered questionnaire was mailed in March and April to 6,130 randomly selected households. Metropolitan counties not included in the sample were Cass, Douglas, Lancaster, Sarpy, Saunders, Seward and Washington. The

Research Report 18-1 of the Nebraska Rural Poll

14-page questionnaire included questions pertaining to well-being, community, community economic development and community social issues. This paper reports only results from the community economic development section.

A 27% response rate was achieved using the total design method (Dillman, 1978). The sequence of steps used follow:

- 1. A pre-notification letter was sent requesting participation in the study.
- The questionnaire was mailed with an informal letter signed by the project manager approximately ten days later.
- A reminder postcard was sent to those who had not yet responded approximately ten days after the questionnaire had been sent.
- 4. Those who had not yet responded within approximately 20 days of the original mailing were sent a replacement questionnaire.

Appendix Table 1 shows demographic data from this year's study and previous rural polls, as well as similar data based on the entire nonmetropolitan population of Nebraska (using the latest available data from the 2012 - 2016 American Community Survey). As can be seen from the table, there are some marked differences between some of the demographic variables in our sample compared to the Census data. Thus, we suggest the reader use caution in generalizing our data to all rural Nebraska. However, given the random sampling frame used for this survey, the acceptable percentage of responses, and the large number of respondents, we feel the data provide useful

¹ In the spring of 2013, the Grand Island area (Hall, Hamilton, Howard and Merrick Counties) was designated a metropolitan area. To facilitate comparisons from previous years, these four counties are still included in our sample. In addition, the Sioux City area metropolitan counties of Dixon and Dakota were added in 2014 because of a joint

Metro Poll being conducted by the University of Nebraska at Omaha to ensure all counties in the state were sampled. Although classified as metro, Dixon County is rural in nature. Dakota County is similar in many respects to other "micropolitan" counties the Rural Poll surveys.

insights into opinions of rural Nebraskans on the various issues presented in this report. The margin of error for this study is plus or minus two percent.

Since younger residents have typically been under-represented by survey respondents and older residents have been over-represented, weights were used to adjust the sample to match the age distribution in the nonmetropolitan counties in Nebraska (using U.S. Census figures from 2010).

The average age of respondents is 50 years. Seventy-one percent are married (Appendix Table 1) and 73 percent live within the city limits of a town or village. On average, respondents have lived in Nebraska 42 years and have lived in their current community 26 years. Fifty-eight percent are living in or near towns or villages with populations less than 5,000. Ninety-seven percent have attained at least a high school diploma.

Twenty-eight percent of the respondents report their 2017 approximate household income from all sources, before taxes, as below \$40,000. Sixty-two percent report incomes over \$50,000.

Seventy-eight percent were employed in 2017 on a full-time, part-time, or seasonal basis. Seventeen percent are retired. Thirty-five percent of those employed reported working in a management, professional, or education occupation. Fourteen percent indicated they were employed in agriculture.

Internet Services

To examine rural Nebraskans' use of mobile Internet services, respondents were asked, "Do you access the Internet using your cell phone (have a cell phone data plan)?" The proportion of rural Nebraskans accessing the Internet using

Research Report 18-1 of the Nebraska Rural Poll

their cell phone has increased compared to two years ago. Just over three-quarters of rural Nebraskans access the Internet using their cell phone (77%), up from 70 percent in 2016 (Figure 1).

Rural Nebraskans' use of mobile Internet services differ by many individual attributes (Appendix Table 2). Younger persons are more likely than older persons to access the Internet using their cell phone. Over nine in ten persons age 19 to 49 access the Internet using their cell phone, compared to 39 percent of persons age 65 and older (Figure 2).

Rural Nebraskans with the highest household incomes are more likely than persons with the lowest household incomes to access the Internet using their cell phone. Ninety-one percent of persons with household incomes of \$60,000 or more access the Internet using their cell phone, compared to 45 percent of persons with household incomes under \$20,000.

Other groups most likely to access the Internet using their cell phone include: married persons; persons who have never married; females; persons with higher education levels; persons

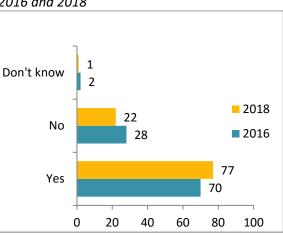

Figure 1. Access the Internet Using Cell Phone, 2016 and 2018

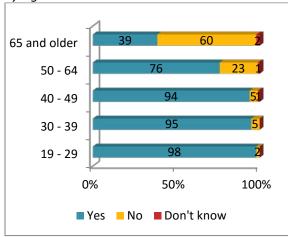

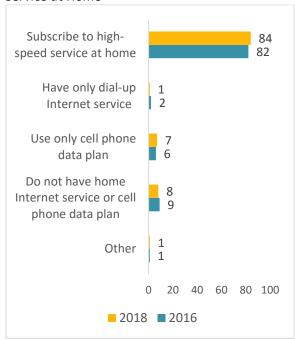

Figure 2. Access the Internet Using Cell Phone by Age

with healthcare support or public safety occupations.

Next, respondents were asked if they subscribe to a high-speed Internet service at home (such as cable Internet, DSL, fiber optic or satellite Internet service) other than a data plan on their cell phone or tablet. Eighty-four percent of rural Nebraskans report subscribing to high-speed Internet service at home, about the same as in 2016 (Figure 3). Seven percent say they only use their cell phone data plan. Eight percent do not subscribe to any Internet service at home and do not have a cell phone data plan. One percent have only dial-up Internet service.

Subscription to home high-speed Internet service differs by community size and various individual attributes (Appendix Table 3). Persons living in or near larger communities are more likely than persons living in or near smaller communities to subscribe to a highspeed Internet service at home. At least eightyfour percent of persons living in or near communities with populations of 500 or more subscribe to a high-speed Internet service at home, compared to 78 percent of persons living

Figure 3. Subscribe to High-Speed Internet Service at Home

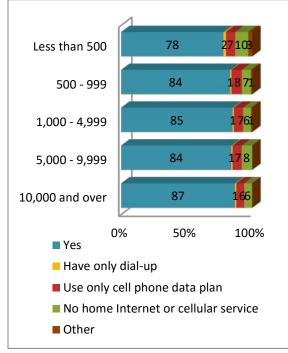

in or near communities with populations less than 500 (Figure 4).

Persons with higher household incomes are more likely than persons with lower household incomes to subscribe to a high-speed Internet service at home. Ninety-three percent of persons with household incomes of \$60,000 or more subscribe to a high-speed Internet service at home, compared to 48 percent of persons with household incomes under \$20,000.

Younger persons are more likely than older persons to subscribe to a high-speed Internet service at home. Ninety-four percent of persons age 19 to 29 subscribe to a high-speed Internet service at home, compared to 67 percent of persons age 65 and older.

Other groups most likely to subscribe to a highspeed Internet service at home include: females; married persons; persons with higher

Figure 4. Subscribe to High-Speed Internet Service at Home by Community Size

education levels; persons with healthcare support or public safety occupations; persons with management, professional or education occupations; and persons with sales or office support occupations.

The respondents who subscribe to a high-speed Internet service were asked what type of service they have at home. One-third (33%) subscribe to cable service, just over one-quarter (27%) have DSL and 20 percent report subscribing to a fixed wireless service (Figure 5).

The type of high-speed Internet service at home differs by community size, region and some individual attributes (Appendix Table 4). Persons living in or near larger communities are more likely than persons living in or near smaller communities to have cable Internet service. Persons living in or near smaller communities are more likely than persons living

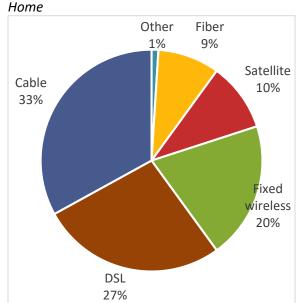

Figure 5. Type of High-Speed Internet Service at

in or near larger communities to have DSL, fixed

wireless and satellite service.

Panhandle residents are more likely than residents of other regions of the state (see Appendix Figure 1 for the counties included in each region) to report having fiber at home. Just over two in ten Panhandle residents who subscribe to Internet at home have fiber. Cable service is most common for residents of the South Central and Northeast regions. Southeast region residents are the regional group most likely to have fixed wireless service and Northeast area residents are most likely to have satellite service.

Younger persons are more likely than older persons to have DSL and fixed wireless service while older persons are more likely to have cable Internet service. Persons with healthcare support or public safety occupations are more likely than persons with different occupations to have fiber. Persons with production, transportation or warehousing occupations

Complete homework/ classes/certifications	34	54	8	4	1

Table 1. How Much Home Internet Service Limits Ability to Do Items

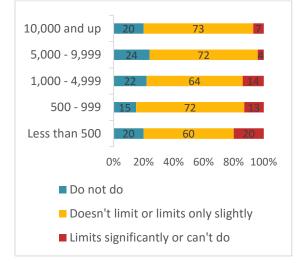

are the group most likely to have cable Internet services.

Persons who have Internet service at home were asked how much, if any, their service limits their ability to do various tasks. Not many rural Nebraskans report significant limitations on their ability to do most tasks. At least one in ten report being limited significantly or not being able to play real time video games or stream online video content such as Netflix.

How much their home Internet service limits their ability to do items varies by community size and region (Appendix Table 5). Persons living in or near smaller communities are more likely than persons living in or near larger communities to say their Internet service limits significantly or prevents them from doing the following: checking email, reading news reports, using online banking services, using social media sites, uploading files, streaming video content, playing real time video games, working from home, videoconferencing, and completing homework/ classes/certifications. As an example, two in ten persons living in or near communities with less than 500 people say their Internet service limits significantly or they can't stream online video content such as Netflix (Figure 6). In contrast, approximately seven percent of persons living in or near communities with populations of 5,000 or more report these same limitations.

Some regional differences also occur. Residents of the both the Northeast and Southeast regions are more likely than residents of other regions of the state to say their Internet service at least significantly limits their ability to do the following: stream online video content, play real time video games and videoconference. Approximately 15 percent of the residents of these two regions report their service limits significantly or won't allow them to stream

Figure 6. How Internet Service Limits Ability to Stream Online Video Content by Community Size

online video content, compared to approximately 10 percent of the residents of the other regions of the state. Residents of both the North Central and Southeast regions are the regional groups most likely to report at least significant limitations to working from home.

Finally, respondents were asked to estimate the economic impact the Internet has had on their

household. Most rural Nebraskans are using the Internet to save money by price matching, finding bargains online, etc. Many are also using it to generate income by occasionally buying, selling or trading items online. Six in ten rural Nebraskans are using the Internet to save money and approximately one-third are generating income by occasionally buying or selling items online (Table 2). Seven percent of rural Nebraskans estimate the impact of saving money as \$1,000 or more annually.

The economic impact of the Internet on households varies by community size, region and many individual attributes (Appendix Table 6). For some items, the economic impact of the Internet is greater in smaller communities. Persons living in or near smaller communities are more likely than persons living in or near larger communities to have used the Internet to earn money by running and growing a homebased business and making the family farm more efficient and/or profitable. Just under one-quarter of persons living in or near the smallest communities estimate some annual economic impact from the Internet by making

	N/A	\$1 - \$99	\$100 - \$999	\$1,000 or more
Saving money by price matching, finding bargains online, etc.	40%	24%	29%	7%
Working at home some of the time	80	6	8	7
Working entirely or primarily at home	92	1	2	5
Running and growing a home-based business	89	2	4	4
Making the family farm more efficient and/or profitable	86	4	5	6
Generating income by freelance work or a side job	89	4	4	3
Generating income by regularly selling through Etsy, Amazon, e-Bay, etc.	87	6	6	2
Generating income by occasionally buying, selling or trading items online	68	17	12	3
Generating income through rentals through Airbnb, VRBO, etc.	97	1	2	1

Table 2. Estimate of Annual Economic Impact to Household from Internet

Research Report 18-1 of the Nebraska Rural Poll

the family farm more efficient and/or profitable. In fact, 12 percent estimate that annual impact as being at least \$1,000. Persons living in or near mid-sized communities are the group most likely to have used the Internet to generate income by freelance work or a side job.

Residents of both the North Central and South Central regions are more likely than residents of other regions of the state to earn money from the Internet by working at home some of the time. Approximately one-quarter of the residents of these two regions are reporting some annual economic impact from working at home some of the time using the Internet.

Residents of the North Central region are the regional group most likely to use the Internet to make the family farm more efficient and/or profitable. Almost one-quarter of North Central residents are using the Internet to generate economic impact for their farm – with 10 percent showing at least \$1,000 of economic impact.

Residents of the Northeast region are the regional group *least* likely to use the Internet to run and grow a home-based business, regularly selling online, or occasionally buying or selling items online. Panhandle residents and residents of the Northeast region are *less* likely than residents of other regions to generate income from the Internet to by freelance work or a side job.

Persons with higher household incomes are more likely than persons with lower incomes to use the Internet to generate economic impact through: saving money, working at home some of the time, working entirely or primarily at home, freelance work or a side job, and occasionally buying or selling items online.

Younger persons are more likely than older persons to have economic impact from each of the items listed, except working entirely or primarily from home or through rentals through Airbnb, VRBO, etc. As an example, 44 percent of persons age 19 to 29 use the Internet to generate income by occasionally buying or selling items online, compared to 11 percent of persons age 65 and older.

Males are more likely than females to have used the Internet to generate income by running and growing a home-based business and making the family farm more efficient and/or profitable.

Persons with higher education levels are more likely than persons with less education to use the Internet to generate income from each of the items listed with the exception of through rentals. As an example, 16 percent of persons with at least a four year college degree generated income by freelance work or a side job, compared to two percent of persons with a high school diploma or less education.

Married persons and persons who have never married are the marital groups most likely to have used the Internet to save money and to occasionally buy or sell items online. Married persons are the group most likely to have used the Internet to work at home some of the time and to make the family farm more efficient and/or profitable. Married persons and persons who are divorced/separated are the groups most likely to have used the Internet to work entirely or primarily at home.

Persons with management, professional or

education occupations as well as persons with sales or office support occupations are the occupation groups most likely to have generated income by working at home some of the time. Just over one-third of the persons with these types of occupations report some annual economic impact from working at home some of the time. In fact, over two in ten persons with sales or office support occupations report at least \$1,000 of annual economic impact from working at home some of the time. Persons with sales or office support occupations are the group most likely to have generated income by working entirely or primarily at home.

Persons with occupations in agriculture are the group most likely to have generated income by running and growing a home-based business, making the family farm more efficient and/or profitable, and regularly selling online. Just over one-half (53%) of persons with occupations in agriculture generate income from the Internet by making the family farm more efficient and/or profitable, with 24 percent reporting at least \$1,000 of impact.

Nature-Based Activities for Tourists

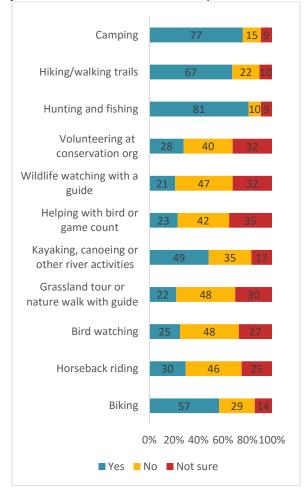

Rural communities benefit from tourism generated from nature. To find out what is available, respondents were asked if they are aware of various nature-based activities for tourists in or near their community.

Most rural Nebraskans are aware of the following activities in or near their community: biking, hunting and fishing, hiking/walking trails and camping. Many are also aware of kayaking, canoeing or other river activities.

Awareness of these activities does differ by community size, region and various individual attributes (Appendix Table 7). Persons living in

Research Report 18-1 of the Nebraska Rural Poll

Figure 7. Awareness of Nature-Based Activities for Tourists In or Near Community

or near larger communities are more likely than persons living in or near smaller communities to say that each of the activities were in or near their community, with the exception of hunting and fishing.

Residents of the Panhandle are more likely than residents from other regions of the state to say the following are located in or near their community: biking, grassland tour or nature walk with a guide, helping with bird or game counts, and hiking/walking trails. Residents of both the Panhandle and North Central regions are the groups most likely to say they are aware of horseback riding in or near their community. Residents of both the Panhandle and South Central regions are most likely to be aware of volunteering activities at a conservation organization. Residents of the South Central region are the regional group most likely to say they are aware of bird watching with a guide and wildlife watching with a guide in or near their community. Persons living in the North Central region are most likely to say kayaking, canoeing or other river activities as well as camping are located in or near their community.

Persons age 40 to 49 are the age group most likely to be aware of the following nature-based activities for tourists in or near their community: horseback riding; kayaking, canoeing or other river activities; and camping. Persons age 30 to 39 are the age group most likely to be aware of hunting and fishing in or near their community and persons age 30 to 64 are the groups most likely to be aware of hiking/walking trails.

Males are more likely than females to be aware of hunting and fishing in or near their community. Persons with higher education levels are more likely than persons with less education to be aware of each of the activities listed, with the exception of horseback riding; kayaking, canoeing or other river activities; hiking/walking trails; and camping.

Persons who are never married are the marital group most likely to be aware of the following activities in or near their community: biking; kayaking, canoeing or other river activities; wildlife watching with a guide; and volunteering at a conservation organization. Married persons and persons who have never married are the groups most likely to be aware of hunting and fishing in or near their community. Persons who have never married and persons who are divorced/separated are the groups most likely to be aware of hiking/walking trails.

When comparing responses by occupation, persons with food service or personal care occupations are the group most likely to be aware of biking in or near their community. Persons with production, transportation or warehousing occupations are the group most likely to be aware of wildlife watching with a guide.

Perceived Impacts of Federal Tax Bill

Federal tax policy can impact many items that influence a community. Respondents were asked how they think various items will change as a result of the new federal tax bill. Overall, many rural Nebraskans are unsure of the expected impacts of the federal tax bill. At least three in ten indicated they don't know how the bill will impact all of the items listed (Figure 8).

Opinions are mixed on the expected impact of the federal tax bill on their household's tax burden. Approximately one-third don't know how their household's tax burden will change, just under one-quarter say it will decrease and a similar proportion say it will increase. At least three in ten rural Nebraskans think the services provided by government and upper income Americans' tax burden will decrease as a result of the federal tax bill. Over one-third think the income gap between the upper and middle income groups and the federal deficit will increase as a result of the bill.

Opinions about the perceived impacts are examined by community size, region and various individual attributes (Appendix Table 8). Persons living in or near larger communities are more likely than persons living in or near

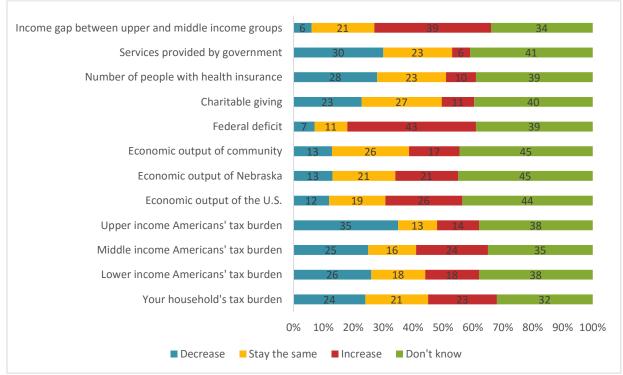

Figure 8. Perceived Impacts of Federal Tax Bill

smaller communities to think the federal deficit and the income gap between the upper and middle income groups will increase as a result of the federal tax bill. This group is also most likely to think the number of people with health insurance and services provided by government will decrease.

Residents of the South Central region are the regional group most likely to think their household's tax burden will increase as a result of the federal tax bill. Residents of both the Panhandle and South Central regions are the groups most likely to think lower income Americans' tax burden will increase as a result of the bill. Panhandle residents are the regional group most likely to think upper income Americans' tax burden will increase. They were also the regional group most likely to think the services provided by government will decrease as a result of the bill. Persons with lower household incomes are more likely than persons with higher incomes to answer don't know for each of the items listed except for the income gap between the upper and middle income groups.

Older persons are more likely than younger persons to think their household's tax burden and the federal deficit will increase as a result of the federal tax bill. Approximately onequarter of persons age 40 and older think their household's tax burden will increase as a result of the bill, compared to approximately 16 percent of persons age 19 to 39.

Younger persons are more likely than older persons to think middle income Americans' tax burden will decrease as a result of the bill. Older persons are more likely than younger persons to think the economic output of the U.S. and charitable giving will decrease. Persons age 40 to 49 are the age group most likely to think the economic output of Nebraska and the economic output of their community will decrease as a result of the bill. Younger persons are more likely than older persons to say they don't know how services provided by government or the income gap between the upper and middle income groups will change.

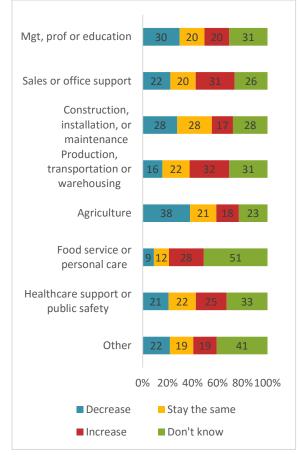

Females are more likely than males to say they don't know how each of the items listed will be impacted by the federal tax bill.

Persons with higher education levels are more likely than persons with less education to say the following items will decrease as a result of the bill: their household's tax burden, lower income Americans' tax burden, middle income Americans' tax burden, upper income Americans' tax burden, charitable giving, and the number of people with health insurance, and services provided by government. As an example, almost three in ten persons with at least a four year degree think their household's tax burden will decrease, compared to 17 percent of persons with a high school diploma or less. Persons with higher education levels are more likely than persons with less education to think the following items will increase as a result of the bill: economic output of the U.S., economic output of Nebraska, the federal deficit, and the income gap between the upper and middle income groups.

Married persons are the marital group most likely to say the following items will decrease as a result of the federal tax bill: their household's tax burden, lower income Americans' tax burden, middle income Americans' tax burden, and upper income Americans' tax burden. Married persons are the group most likely to say the following items will *increase*: economic output of the U.S., economic output of Nebraska, economic output of the community, federal deficit, and charitable giving. When comparing perceptions by occupation, persons with occupations in agriculture are the group most likely to think their household's tax burden will decrease as a result of the federal tax bill. Almost four in ten persons with occupations in agriculture believe their household's tax burden will decrease, compared to nine percent of persons with occupations in food service or personal care (Figure 9).

Persons with occupations in agriculture are also the group most likely to think lower income Americans' tax burden and middle income Americans' tax burden will decrease as a result of the bill. They are the group most likely to

think the following items will *increase*: economic output of the U.S., economic output of Nebraska, and number of people with health insurance.

Persons with sales or office support occupations are the group most likely to believe the economic output of their community will increase as a result of the bill. Persons with production, transportation or warehousing occupations are the group most likely to think the upper income Americans' tax burden will decrease and that the income gap between the upper and middle income groups will increase as a result of the bill.

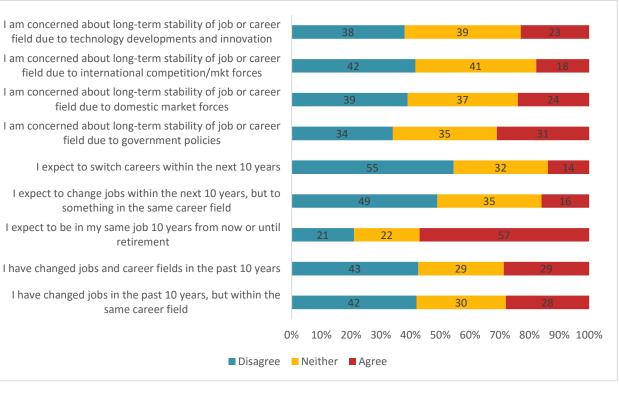

Job/Career Changes and Workforce Training

To measure job and career stability, respondents were asked the extent to which

Figure 10. Job/Career Stability

they agree or disagree with various statements about their current job and career field. Many rural Nebraskans have changed jobs and careers in the past ten years. Most rural Nebraskans expect to be in their same job ten years from now or until retirement. Few rural Nebraskans expect to switch careers in the next ten years. When asked what concerns they have about the long-term stability of their job or career field, opinions are mixed about the impact of government policies. They are less concerned about the impact of domestic market forces, international competition on their job stability and technology developments and innovation on their job stability.

These statements are examined by community size, region and various individual attributes (Appendix Table 9). Persons living in or near larger communities are more likely than persons living in or near the smallest

Research Report 18-1 of the Nebraska Rural Poll

communities to have changed jobs in the past 10 years, but within the same career field. Approximately 27 percent of persons living in or near communities with populations of 500 or more say they have changed jobs within the same career field in the past 10 years. In comparison, 22 percent of persons living in or near communities with populations less than 500 have done the same. Persons living in or near the larger communities are also the most likely to expect to change jobs in the same career field within the next 10 years and expect to switch careers within the next 10 years. Persons living in or near the smallest communities are more likely than persons living in or near larger communities to have changed jobs and career fields in the past ten years.

Panhandle residents are more likely than residents of other regions of the state to expect to change jobs in the same career field within the next ten years. Just under one-quarter of Panhandle residents agree with that statement, compared to 13 percent of residents of the Northeast region. Panhandle residents are also the regional group most likely to expect to switch careers within the next ten years.

Persons with higher household incomes are more likely than persons with lower incomes to have done the following: changed jobs within the same career field in the past 10 years, expect to be in the same job 10 years from now or until retirement, and expect to change jobs in the same career field within the next 10 years. Persons with incomes between \$20,000 and \$39,999 are the income group most likely to have changed jobs and career fields in the past ten years. Persons with the lowest household incomes are the group most likely to be concerned about the impact of domestic market forces, international competition and technology development on their long-term job or career field stability.

Persons age 30 to 39 are the age group most likely to have changed jobs within the same career field in the past 10 years. The youngest persons are more likely than older persons to have changed jobs and career fields in the past decade, expect to change jobs in the same career field within the next ten years, and expect to switch careers within the next ten years. Persons age 50 to 64 are the age group most likely to expect to be in their same job ten years from now or until retirement. Persons age 30 to 64 are the groups most likely to be concerned about the impact of government policies on their long-term job stability. Persons age 50 to 64 are the age group most concerned about the impact of domestic market forces, international competition and technology developments on their job stability.

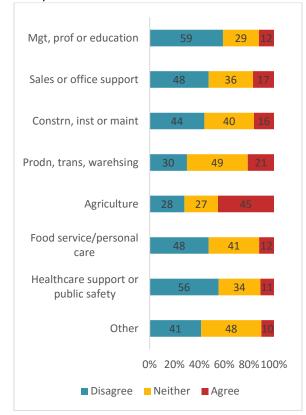

Females are more likely than males to have changed jobs within the same career field in the past decade and expect to change jobs in the same career field within the next ten years. Males are more likely than females to be concerned about the impact of government policies, domestic market forces, international competition and technology developments on their job stability.

Persons with higher education levels are more likely than persons with less education to have changed jobs within the same career field in the past ten years, expect to be in their same job ten years from now or until retirement, and expect to change jobs in the same career field within the next ten years. Persons with some college education (but less than a four year degree) are the education group most likely to have changed jobs and career fields in the past ten years. Persons with the highest education levels are the group most concerned about the impact of government policies and technology developments on their long-term job stability. Persons who have never married are the marital group most likely to have changed jobs and career fields in the past ten years, expect to change jobs to something in the same career field within the next ten years and expect to switch careers within the next ten years. Married persons are the group most likely to expect to be in their same job ten years from now or until retirement.

Persons with healthcare support or public safety occupations are the occupation group most likely to have changed jobs within the same career field in the past ten years. Persons with production, transportation or warehousing occupations are the group most likely to have changed jobs and career fields in the past ten years. Persons with occupations in agriculture are the group most likely to expect to be in their same job ten years from now or until retirement. Persons with food service or personal care occupations are the group most likely to expect to switch careers within the next ten years. Approximately one-third of persons with these types of occupations expect to switch careers in the next ten years.

Persons with occupations in agriculture as well as persons with production, transportation or warehousing occupations are the groups most likely to be concerned about the impact of government policy on their long-term job stability. Persons with occupations in agriculture are the group most concerned about the impact of domestic market forces and international competition on their long-term job stability. Forty-five percent of persons with occupations in agriculture are concerned about the impact of international competition and market forces on their long-term job stability (Figure 11). In comparison, 10 percent of persons with occupations classified as other share this opinion.

Figure 11. Concern about Impact of International Competition on Job Stability by Occupation

Finally, respondents were asked about job training. Specifically they were asked, "Thinking about job skills and training or retraining (for those switching or forced to switch jobs or careers), how much responsibility should each of the following have in making sure Nebraska's workforce has the right skills and education to be successful in today's economy?" They were given a list of various entities to rate.

Most rural Nebraskans think individuals, colleges and universities, community colleges and primary (K - 12) education have a lot of responsibility for job training or retraining (Figure 12).

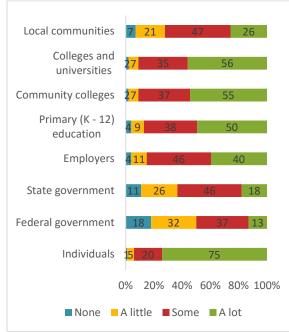

Figure 12. Responsibility for Workforce Training

Opinions about the responsibilities various entities have in workforce training are examined by community size, region and various individual attributes (Appendix Table 10). Residents of both the Panhandle and North Central regions are more likely than residents of other regions of the state to believe that individuals have a lot of responsibility for workforce training. Residents of the North Central region are the group least likely to believe the federal government has a lot of responsibility for training. Panhandle residents are the group most likely to think employers, primary education (K – 12), colleges and universities ad local communities have a lot of responsibility in making sure the state's workforce has the right skills and education.

Persons with higher household incomes are more likely than persons with lower incomes to think individuals and colleges and universities have a lot of responsibility for workforce training. Persons with lower incomes are more likely than those with higher incomes to say the

Research Report 18-1 of the Nebraska Rural Poll

federal government, state government and local communities have a lot of responsibility for job training.

Younger persons are more likely than older persons to believe employers bear a lot of responsibility for workforce training. Sixty percent of persons age 19 to 29 believe employers have a lot of responsibility in making sure the workforce has the right skills and education, compared to 32 percent of persons age 65 and older. The youngest persons are also most likely to believe local communities have a lot of responsibility in workforce training.

Females are more likely than males to believe the following bear a lot of responsibility for workforce training: the state government, employers, primary (K - 12) education, community colleges, colleges and universities and local communities.

Persons with higher education levels are more likely than persons with less education to think the following have a lot of responsibility for job training: individuals, community colleges, colleges and universities and local communities. Persons with less education are more likely than persons with more education to believe the federal and state government have a lot of responsibility for workforce training.

Married persons are the marital group most likely to think that individuals have a lot of responsibility for workforce training. Persons who have never married and widowed persons are the groups most likely to think the federal government has a lot of responsibility for job training. Widowed persons are the group most likely to think the state government and community colleges should play a large role in workforce training. Persons who have never married are the group most likely to think employers have a lot of responsibility in this area.

Persons with management, professional or education occupations are the occupation group most likely to say that individuals themselves bear a lot of responsibility in ensuring Nebraska's workforce has the right skills and education to be successful. Persons with production, transportation or warehousing occupations are the group most likely to think the federal government should play a large role. Persons with occupations in agriculture and persons with healthcare support and public safety occupations are the groups most likely to say employers play a large role in job training. Persons with healthcare support or public safety occupations are the group most likely to say colleges and universities have a lot of responsibility in this area.

Conclusion

The proportion of rural Nebraskans accessing the Internet using their cell phone has increased compared to two years ago. But, the proportion subscribing to high-speed Internet service at home remained stable during the past two years. Persons living in or near the smallest communities are less likely than persons living in or near larger communities to have highspeed Internet service at home.

Not many rural Nebraskans report significant limitations from their home Internet service on their ability to do most tasks. At least one in ten report being limited significantly or not being able to play real time video games or stream online video content such as Netflix. However, persons living in or near smaller communities experience more limitations than do those living in or near larger communities. And, regional differences also occur, with the residents of both the Northeast and Southeast

Research Report 18-1 of the Nebraska Rural Poll

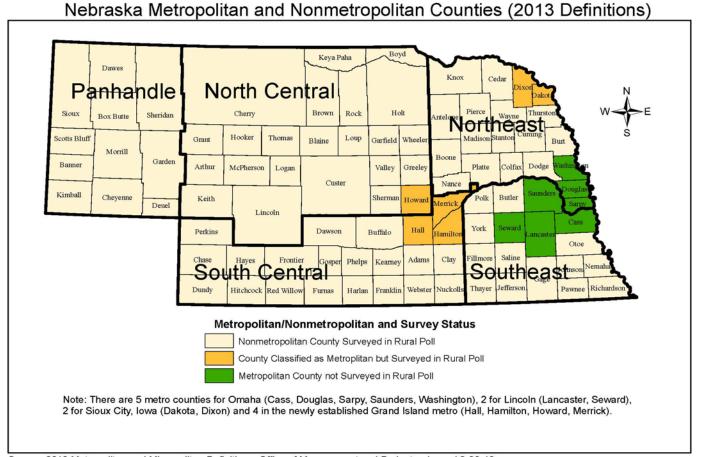

regions experiencing more limitations performing such tasks as streaming online video content, playing real time video games and videoconferencing.

Most rural Nebraskans are using the Internet to save money by price matching, finding bargains online, etc. Many are also using it to generate income by occasionally buying, selling or trading items online. Seven percent of rural Nebraskans estimate the impact of saving money as \$1,000 or more annually. For some items, the economic impact of the Internet is greater in smaller communities. Persons living in or near smaller communities are more likely than persons living in or near larger communities to have used the Internet to earn money by running and growing a home-based business and making the family farm more efficient and/or profitable. Persons with occupations in agriculture are also generating income by running and growing a home-based business, making the family farm more efficient and/or profitable, and regularly selling online.

Most rural Nebraskans are aware of the following nature-based activities for tourists in or near their community: biking, hunting and fishing, hiking/walking trails and camping. Many are also aware of kayaking, canoeing or other river activities.

Overall, many rural Nebraskans are unsure of the expected impacts of the federal tax bill. At least three in ten indicated they don't know how the bill will impact all of the items listed. And, opinions are mixed on the expected impact of the federal tax bill on their household's tax burden. At least three in ten rural Nebraskans think the services provided by government and upper income Americans' tax burden will decrease as a result of the federal tax bill. Over one-third think the income gap between the upper and middle income groups and the federal deficit will increase as a result of the bill.

Many rural Nebraskans have changed jobs and careers in the past ten years. Most rural Nebraskans expect to be in their same job ten years from now or until retirement. Few rural Nebraskans expect to switch careers in the next ten years. Most rural Nebraskans think individuals, colleges and universities, community colleges and primary (K - 12)education have a lot of responsibility for job training or retraining. **Appendix Figure 1. Rural Poll Research Report 18-1, July 2018

It is the policy of the University of Nebraska-Lincoln not to discriminate on the basis of sex, age, disability, race, color, religion, marital status, veteran's status, national or ethnic origin, or sexual orientation.
