EXECUTIVE SUMMARY

Lack of affordable and quality housing in a community can impact its ability to attract new residents and needed workforce. In addition, retirees and young families desire different styles of housing. Given these challenges, what housing programs or priorities do rural Nebraskans support? How do they rate various housing characteristics in their community? What are their general perceptions of housing in their community? This paper provides a detailed analysis of these questions.

This report details 1,010 responses to the 2024 Nebraska Rural Poll, the 29th annual effort to understand rural Nebraskans' perceptions. Respondents were asked a series of questions about housing. Comparisons are made among different respondent subgroups, such as age, occupation, region, etc. Based on these analyses, some key findings emerged:

- **Most rural Nebraskans support a variety of housing programs and priorities.** The support for these various programs was similar to that found in 2016. At least three-quarters of rural Nebraskans would somewhat support or strongly support the following in their community: developing programs to help seniors age in their current home (88%); offering low-interest loans or grants for repair, rehabilitation or home improvement (84%); providing affordable rental housing (82%); establishing a local program that would purchase and remove dilapidated houses making lots available for building (77%); developing senior housing (77%); purchasing, rehabilitating and reselling vacant housing (77%); and establishing a local program that would purchase and remove dilapidated houses and build new homes available for purchase (76%). Less than one-half support the following: developing more downtown upper story living above commercial buildings (45%), starting a local investment club to fund housing projects (36%), and offering free lots to people willing to build homes to sell (28%).
 - Residents of the North Central region are the regional group most likely to support starting a local investment club to fund housing projects. Just over one-half (52%) of the residents of this region support this, compared to less than three in ten residents of the Southeast region.
 - Younger persons are more likely than older persons to support providing down payment assistance to first-time home buyers. Eight in ten persons between the ages of 19 and 29 support providing down payment assistance to first-time home buyers, compared to just over one-half of persons age 65 and over.
- **Rural Nebraskans are less likely to say there are adequate move-in ready homes available for rent or existing homes available for purchase in their community than they did in 2016.** The proportion rating the number of move-in ready homes available for rent (worded as quality homes available for rent in 2016) as adequate declined from 40 percent in 2016 to 25 percent in 2024. The proportion rating the existing homes available for purchase as adequate declined from 39 percent in 2016 to 30 percent in 2024.
- **In 2024, most rural Nebraskans believe there is a shortage of rental houses and apartments as well as homes available for purchase.** Most rural Nebraskans feel there is not enough of the following types of housing in their community: number of homes available for rent (60%), number of move-in ready homes available for rent (56%), number of existing homes available for purchase (55%), number of move-in ready homes available for purchase (54%), and number of safe and affordable apartments available for rent (54%). A slight majority of rural Nebraskans believe there is adequate or more than enough

construction of new homes in their community. Many rural Nebraskans believe there are adequate or more than enough assisted living and long-term care units for seniors in their community.

- Persons living in or near larger communities are more likely than persons living in or near smaller communities to say that the construction of new homes in their community is either adequate or more than enough. Six in ten (60%) of persons living in or near communities with populations of 10,000 or more rate the construction of new homes in their community as either adequate or more than enough, compared to one-third (33%) of persons living in or near communities with populations less than 500. Furthermore, just over one-quarter (26%) of persons living in or near those smallest communities say there is no construction of new homes in their community.
- Persons living in or near larger communities are more likely than persons living in or near smaller communities to say there are not enough existing homes available for purchase, homes available for rent, apartments available for rent, move-in ready homes available for purchase, move-in ready homes available for rent, safe and affordable apartments available for rent, housing for people earning low-to-moderate incomes, senior housing, and assisted living and long-term care units for seniors. However, persons living in or near the smallest communities are the group most likely to say there are no homes available for rent, no apartments available for rent (and specifically safe and affordable apartments available for rent), no move-in ready homes available for purchase or for rent, no housing for people earning low-to-moderate incomes, no senior housing, and no assisted living and long-term care units for seniors in their community.
- Persons living in the North Central region are more likely than persons living in other regions of the state to say there are either none available or not enough of the following in their community: new homes being constructed, existing homes available for purchase, homes available for rent, apartments available for rent, move-in ready homes available for purchase, move-in ready homes available for rent, safe and affordable apartments available for rent, and senior housing in their community. For example, just over three-quarters of North Central residents say there are none available or not enough existing homes available for purchase, compared to just over one-half of persons living in either the Panhandle or Northeast regions.
- **Most rural Nebraskans agree that housing is important to the growth of their community and believe that inadequate housing results in worker shortages.** Most rural Nebraskans agree that high-quality affordable housing is important to the growth of their community. Almost nine in ten strongly agree or agree with that statement. Most rural Nebraskans also agree that inadequate housing options result in worker shortages in their community. Over six in ten strongly agree or agree.
 - Persons living in the North Central region are more likely than persons living in other regions of the state to agree that inadequate housing options result in worker shortages in their community. Over seven in ten (73%) of residents of the North Central region agree with that statement, compared to just under six in ten persons living in the Southeast region.
- **Many rural Nebraskans disagree that it is affordable for a person working in their profession to purchase a home in their community.** Over four in ten strongly disagree or disagree with that statement, while just under four in ten agree or strongly agree.
 - Persons aged 40 to 49 are the age group most likely to agree that it is affordable for a person working in their profession to purchase a home in their community. Just under one-half (49%) of persons aged 40 to 49 agree with that statement, compared to one-quarter of persons aged 19 to 29. Furthermore, approximately two-thirds of the persons aged 19 to 29 disagree with the statement.
- **A slight majority of rural Nebraskans believe their community should invest in public resources to support housing availability.** Just over one-half (52%) agree or strongly agree with that statement, while just under two in ten (19%) disagree or strongly disagree.

- **Many rural Nebraskans agree that businesses in their community have problems recruiting workers because of the lack of housing.** Just under one-half (46%) agree or strongly agree, while less than two in ten disagree or strongly disagree.
 - Residents of the North Central region are more likely than residents of other regions of the state to agree that businesses in their community have problems recruiting workers because of the lack of housing. Just over six in ten residents of the North Central region (62%) agree with that statement, compared to less than four in ten residents of the Panhandle region.

REPORT

INTRODUCTION

Lack of affordable and quality housing in a community can impact its ability to attract new residents and needed workforce. In addition, retirees and young families desire different styles of housing. Given these challenges, what housing programs or priorities do rural Nebraskans support? How do they rate various housing characteristics in their community? What are their general perceptions of housing in their community? This paper provides a detailed analysis of these questions.

This report details 1,010 responses to the 2024 Nebraska Rural Poll, the 29th annual effort to understand rural Nebraskans' perceptions. Respondents were asked a series of questions about housing.

Methodology and Respondent Profile

This study is based on 1,010 responses from Nebraskans living in 86 counties in the state.¹ A self-administered questionnaire was mailed in May and June to 5,887 randomly selected households. Metropolitan counties not included in the sample were Cass, Douglas, Lancaster, Sarpy, Saunders, Seward and Washington. The 14-page questionnaire included questions pertaining to well-being, community, civil discourse, economic and trade policy, housing, and artificial intelligence. This paper reports only results from the housing section.

A 17% response rate was achieved using the total design method (Dillman, 1978). The sequence of steps used follow:

1. A pre-notification letter was sent requesting participation in the study.
2. The questionnaire was mailed with an informal letter signed by the project manager approximately two weeks later.
3. A reminder postcard was sent to those who had not responded approximately two weeks after the questionnaire was sent.
4. Those who had not responded within approximately 30 days of the original mailing were sent a replacement questionnaire.

Appendix Table 1 shows demographic data from this year's study and previous rural polls, as well as similar data based on the entire nonmetropolitan population of Nebraska (using the latest available data from the 2017 - 2021 American Community Survey). As can be seen from the table, there are some marked differences between some of the demographic variables in our sample compared to the Census data. Thus, we suggest the reader use caution when generalizing our data to all rural Nebraska. However, given the random sampling frame used for this survey, the acceptable percentage of responses, and the large number of respondents, we feel the data provide useful insights into the opinions of rural Nebraskans on the various issues presented in this report. The margin of error for this study is plus or minus three percent.

Since younger residents have typically been under-represented by survey respondents and older residents have been over-represented, weights were used to adjust the sample to match the age distribution in the nonmetropolitan counties in Nebraska

¹ In the spring of 2013, the Grand Island area (Hall, Hamilton, Howard and Merrick Counties) was designated a metropolitan area, though Howard County was no longer considered a metropolitan county in 2023. To facilitate comparisons from previous years, these four counties are still included in our sample. In addition, the Sioux City area

metropolitan counties of Dixon and Dakota were added in 2014 because of a joint Metro Poll being conducted by the University of Nebraska at Omaha to ensure all counties in the state were sampled. Although classified as metro, Dixon County is rural in nature. Dakota County is similar in many respects to other "micropolitan" counties the Rural Poll surveys.

(using U.S. Census figures from 2020).

The average age of respondents is almost 51 years. Sixty-nine percent are married (Appendix Table 1) and 62 percent live within the city limits of a town or village. On average, respondents have lived in Nebraska for 43 years and have lived in their current community for over 27 years. Fifty-one percent live in or near towns or villages with populations less than 5,000. Ninety-eight percent have attained at least a high school diploma.

Twenty-one percent of the respondents report their 2023 approximate household income from all sources, before taxes, as below \$40,000. Sixty-six percent report incomes over \$60,000. Seventy-five percent were employed in 2023 on a full-time, part-time, or seasonal basis. Twenty percent are retired. Twenty-eight percent of those employed reported working in a management, professional, or education occupation. Eleven percent indicated they were employed in agriculture.

HOUSING PROGRAMS OR PRIORITIES

First, respondents were given a list of housing programs or priorities and were asked how strongly they would support each in their community. They rated each item using a scale ranging from strongly oppose to strongly support. This question was also asked in 2016. Some of the specific programs and priorities listed were modified in 2024.

Rural Nebraskans' support for various housing programs and priorities was similar in both 2016 and 2024 (Figure 1). The proportions saying they support or strongly support the programs and priorities in 2024 were very similar to those from the 2016 survey.

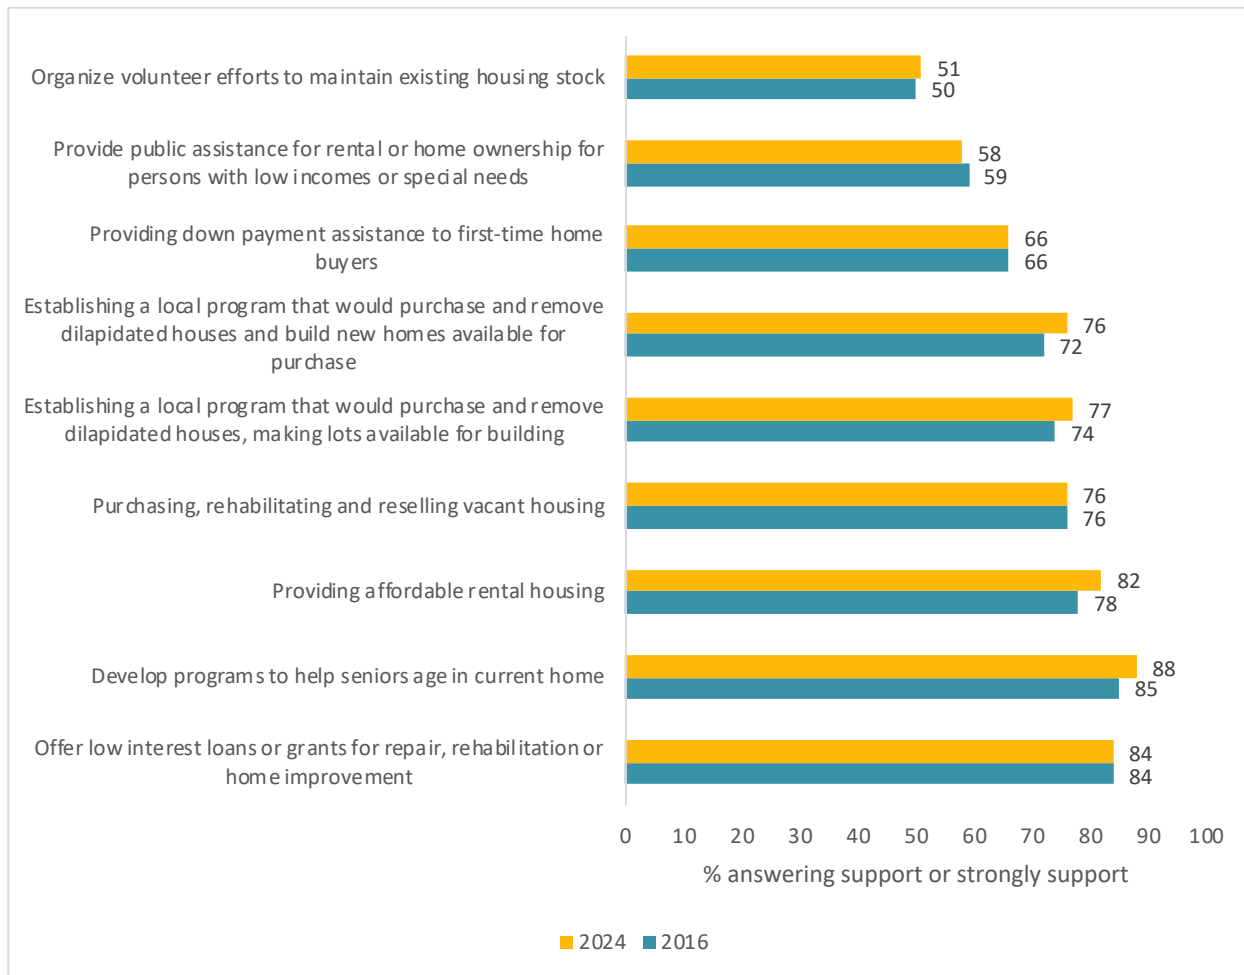

Most rural Nebraskans support a variety of housing programs and priorities. At least three-quarters of rural Nebraskans would somewhat support or strongly support the following in their community: developing programs to help seniors age in their current home (88%); offer

low-interest loans or grants for repair, rehabilitation or home improvement (84%); providing affordable rental housing (82%); establishing a local program that would purchase and remove dilapidated houses making lots available for building (77%); developing senior housing (77%); purchasing, rehabilitating and reselling vacant housing (76%); and establishing a local program that would purchase and remove dilapidated houses and build new homes available for purchase (76%) (Figure 2). Less than one-half support the following: developing more downtown upper story living above commercial buildings (45%), starting a local investment club to fund housing projects (36%), and offering free lots to people willing to build homes to sell (28%). The support for these programs and priorities differ according to community size, region and various individual attributes (Appendix Table 2).

Many differences are noted by community size. Persons living in or near larger communities are more likely than persons living in or near smaller communities to support the following in their community: purchasing, rehabilitating, and reselling vacant housing; organizing a volunteer housing committee to identify housing needs in the community; developing senior housing; offering low-interest loans or grants to homeowners for repair, rehabilitation, or home improvement; providing public assistance for rental or home ownership for persons with low incomes or special needs; and developing more downtown upper story living above commercial buildings. As an example, almost nine in ten persons living in or near communities with populations of 10,000 or more support developing senior housing in their community, compared to just under seven in ten persons living in or near communities with populations under 1,000.

Persons living in or near communities with populations between 500 and 999 are the community size group most likely to support offering free lots to people willing to build homes they will occupy. Approximately two-thirds of persons living in or near this size of community support offering free lots to people willing to build homes they will occupy, compared to just over four in ten persons living in or near

Figure 1. Support for housing programs or priorities, 2016 and 2024

communities with populations ranging from 5,000 to 9,999. Persons living in or near smaller communities are more likely than persons living in or near larger communities to support offering free lots to people willing to build homes to sell. Persons living in or near communities with populations ranging from 1,000 to 4,999 are the group most likely to support starting a local investment club to fund housing projects.

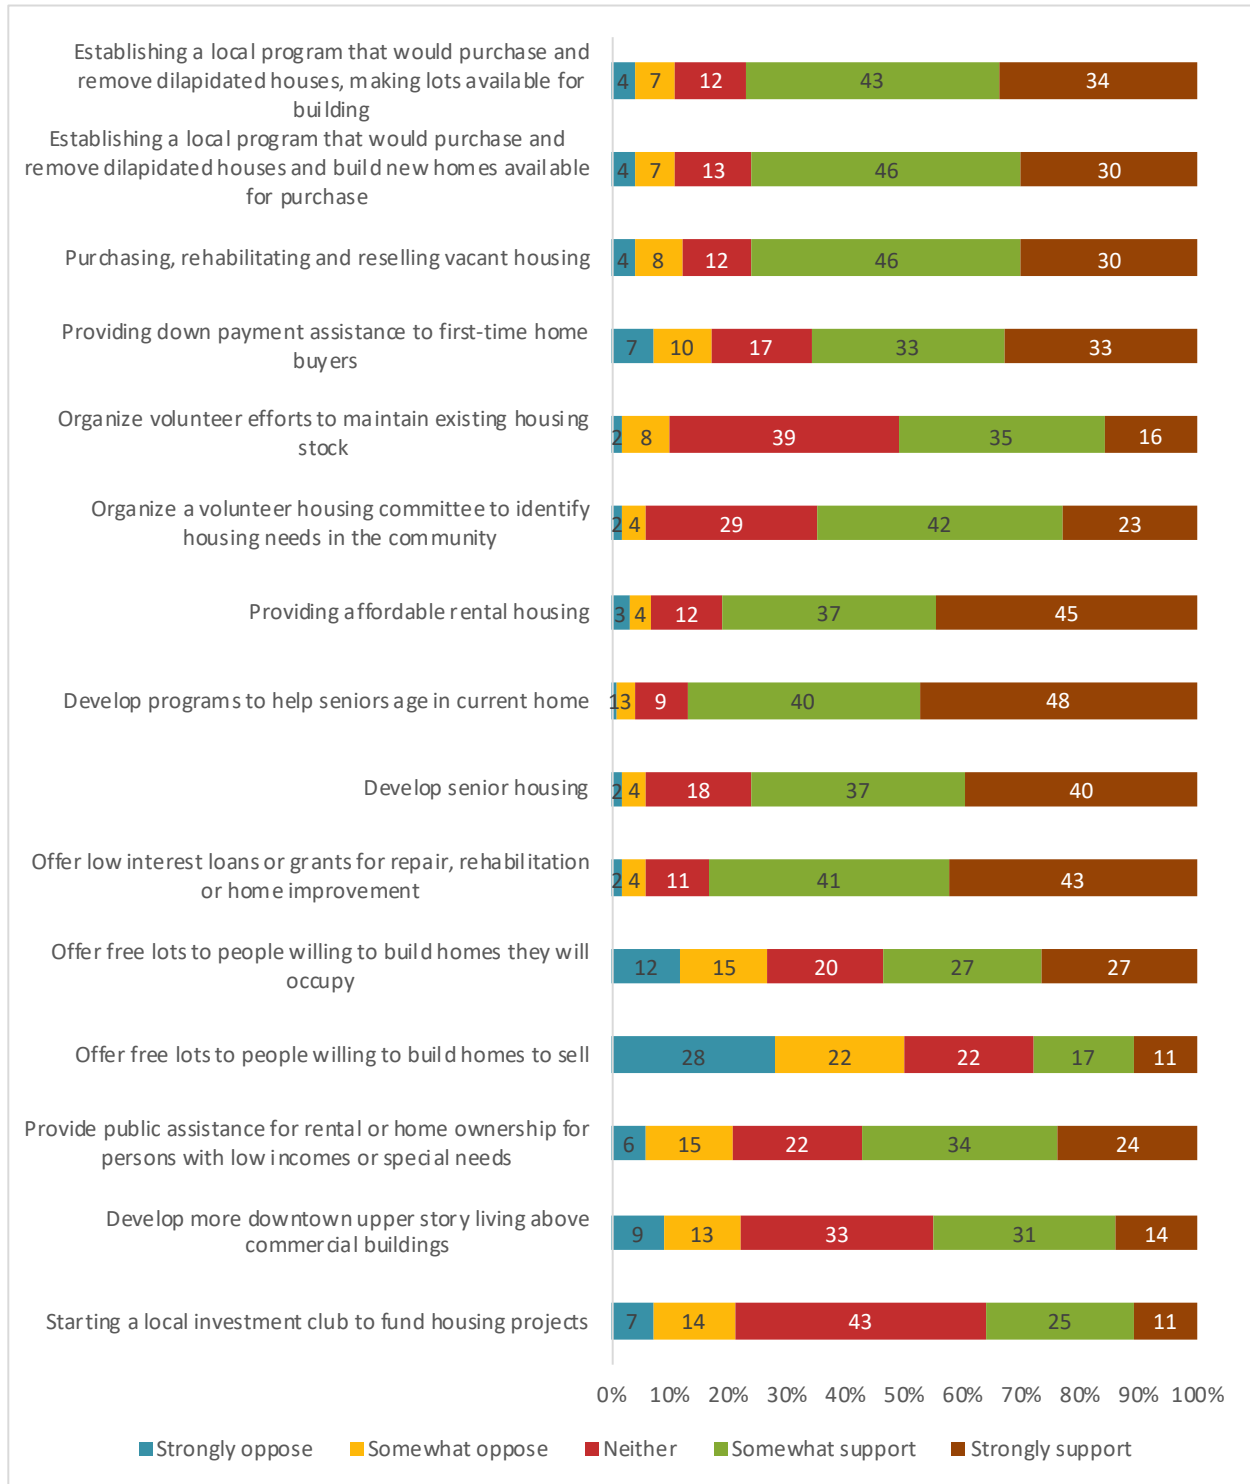

Regional differences are present for some of the items listed. Residents of the Northeast region (see Appendix Figure 1 for the counties included in each region) are more likely than persons living in other regions of the state to support providing down payment assistance to first-time home buyers. Residents of both the Panhandle and North Central regions are most likely to support developing programs to help seniors age in their current homes, developing senior housing, and offering low interest loans or grants to homeowners for

repair, rehabilitation, or home improvement. As an example, approximately nine in ten residents of these two regions support developing senior housing in their community, compared to just under seven in ten residents of the Northeast region.

Residents of the South Central region are the group most likely to support providing public assistance for rental or home ownership for persons with low incomes or special needs. Residents of the North Central region are the group most likely to support starting a local investment club to fund housing projects. Just over one-half (52%) of the residents of this region support this, compared to less than three in ten residents of the Southeast region (Figure 3).

Some differences are also detected by household income. Persons with higher household incomes are more likely than persons with lower incomes to support:

Figure 2. Support for housing programs or priorities in communities

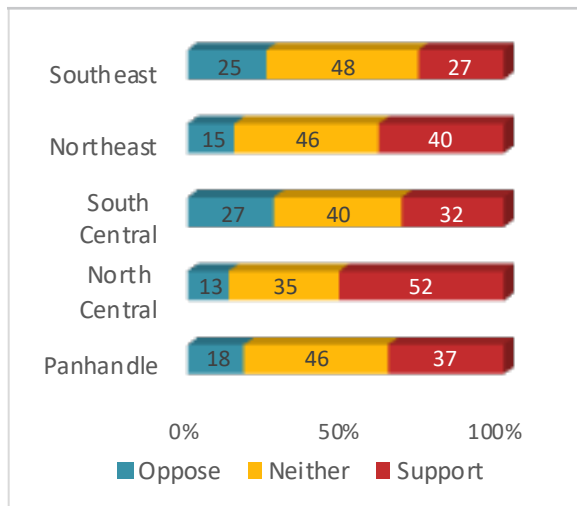

establishing a local program that would purchase and remove dilapidated houses, making lots available for building as well as developing more downtown upper story living above commercial buildings.

Persons with middle-incomes are more likely than persons with either the lowest

or highest incomes to support providing affordable rental housing.

Persons with lower household incomes are more likely than persons with higher incomes to support the following: offering low interest loans or grants to homeowners for repair, rehabilitation, or home

Figure 3. Support for starting a local investment club to fund housing projects by region

improvement; offering free lots to people willing to build homes to sell; and providing public assistance for rental or home ownership for persons with low incomes or special needs. As an example, just over seven in ten persons with the lowest household incomes support providing public assistance for rental or home ownership for persons with low incomes or special needs, compared to just over one-half of persons with higher incomes.

Differences in the level of support for some of these housing programs or priorities are also observed by age. Younger persons are more likely than older persons to support the following programs or priorities: providing down payment assistance to first-time home buyers; providing affordable rental housing; and offering free lots to people willing to build homes they will occupy. As an example, eight in ten persons between the ages of 19 and 29 support providing down payment assistance to first-time home buyers, compared to just over one-half of persons aged 65 and over (Figure 4).

Persons between the ages of 40 and 49 are the group most likely to support: establishing a program that would purchase and remove dilapidated houses and build new homes available for purchase; purchasing, rehabilitating and reselling vacant housing; organizing a volunteer housing committee to identify housing needs in the community; offering free

Figure 4. Support for providing down payment assistance to first-time home buyers by age

lots to people willing to build homes to sell; developing more downtown upper story living above commercial buildings; and starting a local investment club to fund housing projects. Older persons are more likely than younger persons to support developing senior housing in their community.

When examining support for these programs or priorities by gender, females are more likely than males to support many of the proposed items. Females are more likely than males to support the following: establishing a local program that would purchase and remove dilapidated houses, making lots available for building; purchasing, rehabilitating and reselling vacant housing; providing down payment assistance to first-time home buyers; providing affordable rental housing; offering low-interest loans or grants for repair, rehabilitation, or home improvement; and providing public assistance for rental or home ownership for persons with low incomes or special needs.

A few differences are detected by education level. Persons with higher education levels are more likely than persons with less education to support establishing a local program that would purchase and remove dilapidated houses making lots available for building and developing more downtown upper story living above commercial buildings. Persons

with at least some college are more likely than persons with less education to support offering free lots to people willing to build homes they will occupy. Persons with lower education levels are the group most likely to support providing public assistance for rental or home ownership for persons with low incomes or special needs.

There are some differences in the level of support by marital status. Married persons are the group most likely to support establishing a local program that would purchase and remove dilapidated houses making lots available for building; establishing a local program that would purchase and remove dilapidated houses and build new homes available for purchase; and purchasing, rehabilitating, and reselling vacant housing.

Persons who have never married are the marital group most likely to support providing down payment assistance to first-time home buyers; offering free lots to people willing to build homes they will occupy; and providing public assistance for rental or home ownership for persons with low incomes or special needs. Eight in ten persons who have never married support providing down payment assistance to first-time home buyers, compared to six in ten widowed persons.

Both widowed persons and persons who are divorced or separated are the groups most likely to support developing senior housing.

Many differences in the level of support for these programs or priorities are detected by occupation. Persons with food service or personal care occupations are the group most likely to support the following: establishing a local program that would purchase and remove dilapidated houses, making lots available for building; establishing a local program that would purchase and remove dilapidated houses and build new homes available for purchase; organizing a volunteer housing committee to identify housing needs in the community; developing senior housing; offering free lots to people willing to build homes they will occupy; and starting a local investment club to fund housing projects.

Persons with sales or office support occupations are the group most likely to support providing down payment assistance to first-time home buyers. Persons with management, professional, or education occupations are the group most likely to support offering free lots to people willing to build homes to sell.

HOUSING IN COMMUNITY

Next, respondents were asked to rate various housing characteristics in their local community. This same question was also asked in 2016. The proportion of respondents rating each as adequate decreased from 2016 to 2024 (Figure 5). Many of the differences are slight but a couple saw large changes. The proportion rating the number of move-in ready homes available for rent (worded as quality homes available for rent in 2016) as adequate declined from 40 percent in 2016 to 25 percent this year. The proportion rating the existing homes available for purchase as adequate declined from 39 percent in 2016 to 30 percent this year.

This year, most rural Nebraskans believe there is a shortage of rental houses and apartments as well as homes available for purchase. Most rural Nebraskans feel there is not enough of the following types of housing in their community: number of homes available for rent (60%), number of move-in ready homes available for rent (56%), number of existing homes available for purchase (55%), number of move-in ready homes available for purchase (54%), and number of safe and affordable apartments available for rent (54%) (Figure 6). A slight majority of rural Nebraskans believe there is adequate or more than enough construction of new homes in their community. Many rural Nebraskans believe there are adequate or more than enough assisted living and long-term care units for seniors in their community.

The ratings of the housing characteristics in their local community are examined by community size, region, and various individual attributes (Appendix Table 3). Many differences are detected. Persons living in or near larger communities are

Figure 5. Ratings of adequacy of housing in communities, 2024 and 2016

more likely than persons living in or near smaller communities to say that the construction of new homes in their community is either adequate or more than enough. Six in ten (60%) of persons living in or communities with populations of 10,000 or more rate the construction of new homes in their community as either adequate or more than enough, compared to one-third (33%) of persons living in or

near communities with populations less than 500 (Figure 7). Furthermore, just over one-quarter (26%) of persons living in or near those smallest communities say there is no construction of new homes in their community.

In general, persons living in or near larger communities are more likely than persons living in or near smaller communities to

Figure 6. Ratings of housing in communities

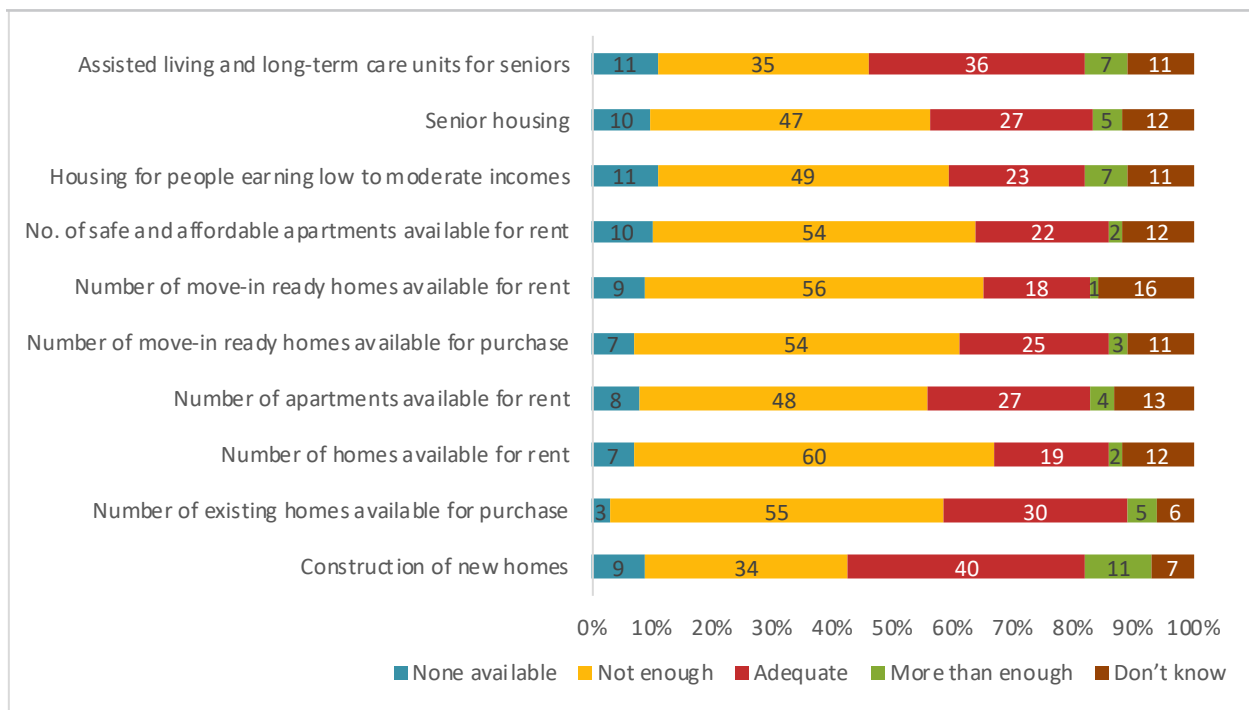

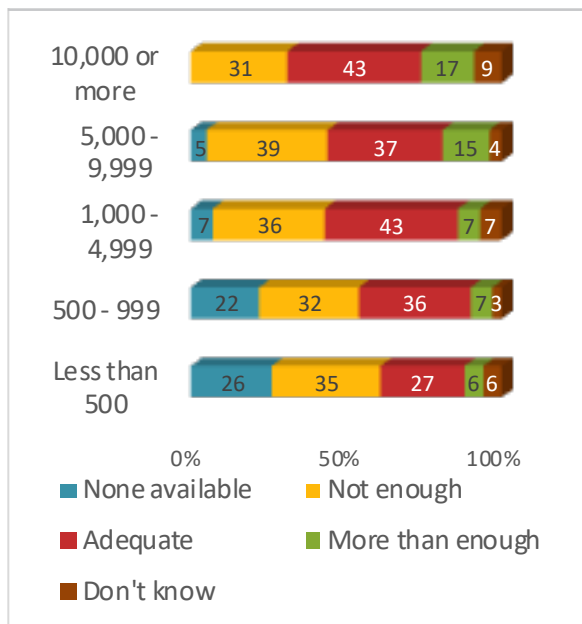

Figure 7. Adequacy of construction of new homes by community size

say there are not enough existing homes available for purchase, homes available for rent, apartments available for rent, move-in ready homes available for purchase, move-in ready homes available for rent, safe and affordable apartments available for rent, housing for people earning low-to-moderate incomes, senior housing, and assisted living and long-term care units for seniors. As an example, six in ten persons living in or near communities with populations ranging from 1,000 to 9,999 say there are not enough existing homes available for purchase, compared to just under one-half of persons living in or near communities with populations under 500.

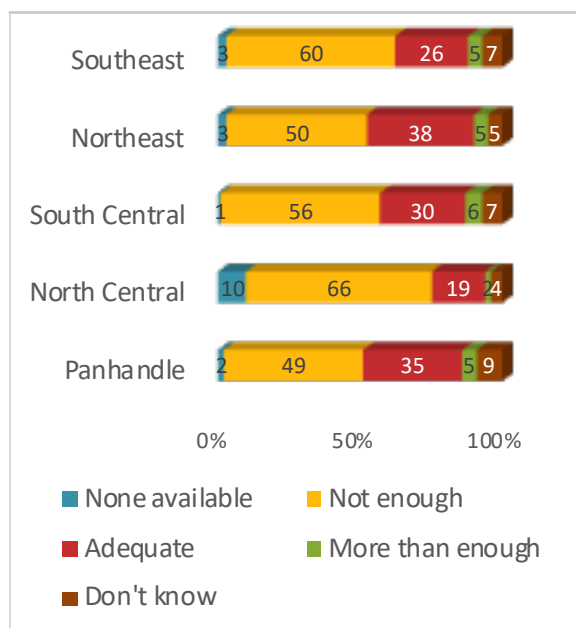

However, persons living in or near the smallest communities are the group most likely to say there are no homes available for rent, no apartments available for rent (and specifically safe and affordable apartments available for rent), no move-in ready homes available for purchase or for rent, no housing for people earning low-to-moderate incomes, no senior housing, and no assisted living and long-term care units for seniors in their community. Just under one-quarter of this group (23%) say there are no apartments available for rent and the same proportion say there are no move-in ready homes available for purchase or rent in their community. Almost three in ten (28%) of persons living in or near the

smallest communities say there are no safe and affordable apartments available for rent in their community and one-quarter (25%) say there is no housing for people earning low-to-moderate incomes. Three in ten people living in or near the smallest communities say there is no senior housing and just over four in ten (43%) say there are no assisted living and long-term care units for seniors in their community.

Persons living in the North Central region are more likely than persons living in other regions of the state to say there are none available or not enough of the following in their community: new homes being constructed, existing homes available for purchase, homes available for rent, apartments available for rent, move-in ready homes available for purchase, move-in ready homes available for rent, safe and affordable apartments available for rent, and senior housing in their community. As an example, just over three-quarters of North Central residents say there are none available or not enough existing homes available for purchase, compared to just over one-half of persons living in either the Panhandle or Northeast regions (Figure 8).

Residents of the South Central region join the residents of the North Central region as most likely to say there is none available or not enough housing for people earning low-

Figure 8. Adequacy of existing homes available for purchase by region

to-moderate incomes.

Panhandle residents are the regional group most likely to say there are none available or not enough assisted living and long-term care units for seniors in their community. Almost two-thirds of Panhandle residents say there are either none available or not enough of these types of units in their community, compared to just over one-third (35%) of residents of the Northeast region.

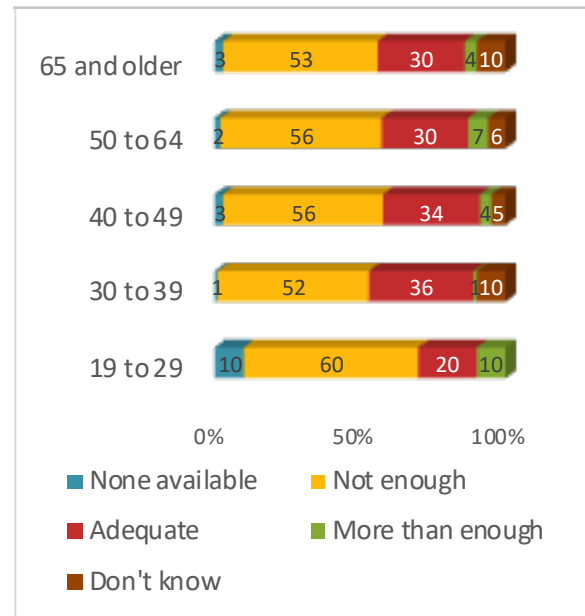

When comparing the ratings by household income, a few differences are detected. Persons with middle-level incomes are more likely than persons with both lower and higher incomes to say there are either none available or not enough apartments available for rent, safe and affordable apartments available for rent, and assisted living and long-term care units for seniors in their community. Persons with higher incomes are more likely than persons with lower incomes to say there are either none available or not enough move-in ready homes available for rent.

Persons between the ages of 40 and 49 are the age group most likely to say there are either none available or not enough construction of new homes or move-in ready homes available for rent in their community.

Younger persons are more likely than older persons to say there are either none available or not enough existing homes available for purchase or housing for people earning low-to-moderate incomes in their community. Seven in ten persons between the ages of 19 and 29 say there are none available or not enough existing homes available for purchase, compared to just over one-half of persons aged 30 to 39 (Figure 9).

Older persons are more likely than younger persons to say there are none available or not enough senior housing or assisted living and long-term care units for seniors in their community. Over six in ten persons age 40 and older say there are none available or not enough senior housing in their community, compared to four in ten persons aged 19 to 29.

Figure 9. Adequacy of existing homes available for purchase by age

Just over one-half of persons age 50 and older say there are none available or not enough assisted living and long-term care units for seniors in their community.

Some differences are also detected by gender. Males are more likely than females to say there are either none available or not enough construction of new homes in their community. Females are more likely than males to say there are none available or not enough of the following in their community: existing homes available for purchase, homes available for rent, and move-in ready homes available for purchase.

A few differences are noted by marital status. Persons who have never married are the marital group most likely to say there are either none available or not enough homes available for rent or safe and affordable apartments available for rent in their community. Eight in ten persons who have never married say there are none available or not enough homes available for rent in their community.

Married persons are the group most likely to say there are none available or not enough move-in ready homes available for purchase in their community. Persons who are divorced or separated are the group most likely to say there are none available or not enough senior housing. Widowed

persons are the group most likely to say there are either none available or not enough assisted living and long-term care units for seniors.

When comparing responses by education level, some differences are detected. Persons with higher education levels are more likely than persons with less education to say there are either none available or not enough existing homes available for purchase, move-in ready homes available for purchase, move-in ready homes available for rent, safe and affordable apartments available for rent, and housing for people earning low-to-moderate incomes in their community.

Occupational differences also exist. Persons with occupations in agriculture are more likely than persons with different occupations to say there are either none available or not enough construction of new homes, move-in ready homes available for purchase, and move-in ready homes available for rent in their community. Persons with production, transportation, or warehousing occupations are the group most likely to say there are none available or not enough safe and affordable apartments for rent or assisted living and long-term care units for seniors.

Persons with food service or personal care occupations are the group most likely to say there are either none available or not enough housing for people earning low-to-moderate incomes in their community. Just

over three-quarters of persons with these types of occupations say there are none available or not enough housing for persons with moderate to low incomes in their community.

Finally, respondents were given some statements about housing in their community and were asked to indicate the extent to which they agree or disagree with each. They also had the option of answering “don’t know.”

Most rural Nebraskans agree housing is important to the growth of their community and believe inadequate housing results in worker shortages.

Most rural Nebraskans agree that high quality affordable housing is important to the growth of their community. Almost nine in ten strongly agree or agree with that statement (Figure 10). Most rural Nebraskans also agree that inadequate housing options result in worker shortages in their community. Over six in ten strongly agree or agree.

Many rural Nebraskans disagree that it is affordable for a person working in their profession to purchase a home in their community. Over four in ten strongly disagree or disagree with that statement, while just under four in ten agree or strongly agree.

A slight majority of rural Nebraskans believe their community should invest

Figure 10. *Perceptions of housing in communities*

public resources to support the availability of housing. Just over one-half (52%) agree or strongly agree with that statement, while just under two in ten (19%) disagree or strongly disagree.

Many rural Nebraskans agree that businesses in their community have problems recruiting workers because of the lack of housing. Just under one-half (46%) agree or strongly agree, while less than two in ten agree or strongly agree.

Differences in the perceptions of housing in their community are examined by community size, region, and various individual attributes (Appendix Table 4). Many differences are detected.

Persons living in or near larger communities are more likely than persons living in or near smaller communities to agree that high quality affordable housing is important to the growth of their community. Approximately nine in ten persons living in or near communities with populations of 500 or more agree with that statement, compared to just over seven in ten persons living in or near communities with populations under 500.

The other groups most likely to agree that high quality affordable housing is important to the growth of their community include: persons with higher household incomes, married persons, and persons with higher education levels.

Persons living in the North Central region are more likely than persons living in other regions of the state to agree that inadequate housing options result in worker shortages in their community. Over seven in ten (73%) of residents of the North Central region agree with that statement, compared to just under six in ten persons living in the Southeast region (Figure 11).

Younger persons are more likely than older persons to say inadequate housing options result in worker shortages in their community. Seven in ten persons aged 19 to 29 agree with that statement, compared to approximately six in ten persons aged 30 and older.

The other groups most likely to agree that

Figure 11. Inadequate housing options result in worker shortages in their community by region

inadequate housing options result in worker shortages in their community include: persons with higher household incomes, persons with higher education levels, persons with food service or personal care occupations, and persons with management, professional, or education occupations.

Persons aged 40 to 49 are the age group most likely to agree that it is affordable for a person working in their profession to purchase a home in their community. Just under one-half (49%) of persons aged 40 to 49 agree with that statement, compared to one-quarter of persons aged 19 to 29 (Figure 12). Furthermore, approximately two-thirds of the persons aged 19 to 29 disagree with the statement.

Figure 12. It is affordable for person in my profession to purchase a home in my community by age

Figure 13. *Businesses in my community have problems recruiting workers because of lack of housing by region*

The other groups most likely to agree that it is affordable for a person working in their profession to purchase a home in their community include: residents of the Southeast region, Panhandle residents, persons with higher household incomes, males, married persons, persons with higher education levels, persons with healthcare support or public safety occupations, and persons with management, professional, or education occupations.

Persons living in or near larger communities are more likely than persons living in or near smaller communities to agree that their community should invest public resources to support the availability of housing in the community. Almost six in ten persons living in or near communities with populations of 5,000 or more agree with this statement, compared to just over four in ten persons living in or near communities with populations under 1,000.

Other groups most likely to agree that their community should invest public resources to support the availability of housing in the community include: persons aged 40 to 49, females, and persons with production, transportation, or warehousing occupations.

Residents of the North Central region are more likely than residents of other regions of the state to agree that businesses in their community have problems recruiting workers because of the lack of housing.

Just over six in ten residents of the North Central region (62%) agree with that statement, compared to less than four in ten residents of the Panhandle region (Figure 13).

Other groups most likely to agree that businesses in their community have problems recruiting workers because of the lack of housing include: persons living in or near communities with populations ranging from 5,000 to 9,999; persons with higher household incomes; persons aged 40 to 49; married persons; persons who have never married; persons with at least a four-year degree; and persons with occupations in agriculture.

CONCLUSION

Most rural Nebraskans support a variety of housing programs and priorities. The support for these various programs was similar to that found in 2016. At least three-quarters of rural Nebraskans would somewhat support or strongly support the following in their community: developing programs to help seniors age in their current home; offering low-interest loans or grants for repair, rehabilitation or home improvement; providing affordable rental housing; establishing a local program that would purchase and remove dilapidated houses making lots available for building; developing senior housing; purchasing, rehabilitating and reselling vacant housing; and establishing a local program that would purchase and remove dilapidated houses and build new homes available for purchase. Less than one-half support the following: developing more downtown upper story living above commercial buildings, starting a local investment club to fund housing projects, and offering free lots to people willing to build homes to sell.

Different demographic groups had varying levels of support for the programs and priorities. As an example, residents of the North Central region are the regional group most likely to support starting a local investment club to fund housing projects. And, younger persons are more likely than older persons to support providing down payment assistance to first-time home

buyers.

Rural Nebraskans are less likely to say there are adequate move-in ready homes available for rent or existing homes available for purchase in their community than they did in 2016. This year, most rural Nebraskans believe there is a shortage of rental houses and apartments as well as homes available for purchase. Most rural Nebraskans feel there is not enough of the following types of housing in their community: number of homes available for rent, number of move-in ready homes available for rent, number of existing homes available for purchase, number of move-in ready homes available for purchase, and number of safe and affordable apartments available for rent. A slight majority of rural Nebraskans believe there is adequate or more than enough construction of new homes in their community. Many rural Nebraskans believe there are adequate or more than enough assisted living and long-term care units for seniors in their community.

The ratings of adequacy of the various housing types varied by community size. Persons living in or near larger communities are more likely than persons living in or near smaller communities to say construction of new homes in their community is either adequate or more than enough, but are also more likely to say there is not enough of the various housing types available in their community. However, persons living in or near the smallest communities are the group most likely to say there are none of the various types available in their community.

When comparing responses by region, persons living in the North Central region are more likely than persons living in other regions of the state to say there are either none available or not enough of the many types of housing in their community.

Most rural Nebraskans agree that high quality affordable housing is important to the growth of their community and also agree that inadequate housing options result in worker shortages in their community. Persons living in the North Central region are more likely than persons living in other regions of the state to agree that inadequate housing options result in

worker shortages in their community.

Many rural Nebraskans disagree that it is affordable for a person working in their profession to purchase a home in their community. This was especially true for young people (aged 19 to 29).

A slight majority of rural Nebraskans believe their community should invest public resources to support the availability of housing. Many rural Nebraskans agree that businesses in their community have problems recruiting workers because of the lack of housing. This was especially true for residents of the North Central region.
